

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

- **Highest-Performance Floating-Point Digital Signal Processor (DSP): TMS320C6713B**
 - Eight 32-Bit Instructions/Cycle
 - 32/64-Bit Data Word
 - 300-, 225-, 200-MHz (GDP and ZDP), and 225-, 200-, 167-MHz (PYP) Clock Rates
 - 3.3-, 4.4-, 5-, 6-Instruction Cycle Times
 - 2400/1800, 1800/1350, 1600/1200, and 1336/1000 MIPS/MFLOPS
 - Rich Peripheral Set, Optimized for Audio
 - Highly Optimized C/C++ Compiler
 - Extended Temperature Devices Available
- **Advanced Very Long Instruction Word (VLIW) TMS320C67x™ DSP Core**
 - Eight Independent Functional Units:
 - 2 ALUs (Fixed-Point)
 - 4 ALUs (Floating-/Fixed-Point)
 - 2 Multipliers (Floating-/Fixed-Point)
 - Load-Store Architecture With 32 32-Bit General-Purpose Registers
 - Instruction Packing Reduces Code Size
 - All Instructions Conditional
- **Instruction Set Features**
 - Native Instructions for IEEE 754
 - Single- and Double-Precision
 - Byte-Addressable (8-, 16-, 32-Bit Data)
 - 8-Bit Overflow Protection
 - Saturation; Bit-Field Extract, Set, Clear; Bit-Counting; Normalization
- **L1/L2 Memory Architecture**
 - 4K-Byte L1P Program Cache (Direct-Mapped)
 - 4K-Byte L1D Data Cache (2-Way)
 - 256K-Byte L2 Memory Total: 64K-Byte L2 Unified Cache/Mapped RAM, and 192K-Byte Additional L2 Mapped RAM
- **Device Configuration**
 - Boot Mode: HPI, 8-, 16-, 32-Bit ROM Boot
 - Endianness: Little Endian, Big Endian
- **32-Bit External Memory Interface (EMIF)**
 - Glueless Interface to SRAM, EPROM, Flash, SBSRAM, and SDRAM
 - 512M-Byte Total Addressable External Memory Space
- **Enhanced Direct-Memory-Access (EDMA) Controller (16 Independent Channels)**
- **16-Bit Host-Port Interface (HPI)**
- **Two McASPs**
 - Two Independent Clock Zones Each (1 TX and 1 RX)
 - Eight Serial Data Pins Per Port: Individually Assignable to any of the Clock Zones
 - Each Clock Zone Includes:
 - Programmable Clock Generator
 - Programmable Frame Sync Generator
 - TDM Streams From 2-32 Time Slots
 - Support for Slot Size: 8, 12, 16, 20, 24, 28, 32 Bits
 - Data Formatter for Bit Manipulation
 - Wide Variety of I2S and Similar Bit Stream Formats
 - Integrated Digital Audio Interface Transmitter (DIT) Supports:
 - S/PDIF, IEC60958-1, AES-3, CP-430 Formats
 - Up to 16 transmit pins
 - Enhanced Channel Status/User Data
 - Extensive Error Checking and Recovery
- **Two Inter-Integrated Circuit Bus (I²C Bus™) Multi-Master and Slave Interfaces**
- **Two Multichannel Buffered Serial Ports:**
 - Serial-Peripheral-Interface (SPI)
 - High-Speed TDM Interface
 - AC97 Interface
- **Two 32-Bit General-Purpose Timers**
- **Dedicated GPIO Module With 16 pins (External Interrupt Capable)**
- **Flexible Phase-Locked-Loop (PLL) Based Clock Generator Module**
- **IEEE-1149.1 (JTAG†) Boundary-Scan-Compatible**
- **208-Pin PowerPAD™ PQFP (PYP)**
- **272-BGA Packages (GDP and ZDP)**
- **0.13-μm/6-Level Copper Metal Process – CMOS Technology**
- **3.3-V I/Os, 1.2‡-V Internal (GDP/ZDP/ PYP)**
- **3.3-V I/Os, 1.4-V Internal (GDP/ZDP) [300 MHz]**

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

TMS320C67x and PowerPAD are trademarks of Texas Instruments.

I²C Bus is a trademark of Philips Electronics N.V. Corporation

All trademarks are the property of their respective owners.

† IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture.

‡ These values are compatible with existing 1.26-V designs.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

REVISION HISTORY

The TMS320C6713B device-specific documentation has been split from *TMS320C6713, TMS320C6713B Floating-Point Digital Signal Processors*, literature number SPRS186K, into a separate Data Sheet, literature number SPRS294. It also highlights technical changes made to SPRS294 to generate SPRS294A. These changes are marked by “[**Revision A**].” **Additionally**, made changes to SPRS294A to generate SPRS294B. These changes are marked by “[**Revision B**].” Both Revision A and B changes are noted in the Revision History table below.

Scope: Updated information on McASP, McBSP and JTAG for clarification. Changed Pin Description for A12 and B11 (Revisions SPRS294 and SPRS294A). Updated Nomenclature figure by adding device-specific information for the ZDP package. TI Recommends for *new designs* that the following pins be configured as such:

- Pin A12 connected directly to CV_{DD} (core power)
- Pin B11 connected directly to V_{SS} (ground)

| PAGE(S) NO. | ADDITIONS/CHANGES/DELETIONS |
|----------------|---|
| 6 | Terminal Assignments for the 272-Ball GDP and ZDP Packages (in Order of Ball No.) table: Updated Signal Name for Ball No. A12 Updated Signal Name for Ball No. B11 |
| 10 | PYP PowerPAD QFP package (top view): Updated drawing |
| 32 | Device Configurations, device configurations at device reset section: Updated “For proper device operation...” paragraph [Revision B] |
| 33 | Device Configurations, Device Configurations Pins at Device Reset (HD[4:3], HD8, HD12, and CLKMODE0) section: Removed “CE1 width 32-bit” from Functional Description for “00” in HD[4:3](BOOTMODE) Configuration Pin |
| 33 | Device Configurations, Device Configurations Pins at Device Reset (HD[4:3], HD8, HD12, and CLKMODE0) section: Updated “All other HD pins...” footnote [Revision B] |
| 37 | Table 22 Peripheral Pin Selection Matrix: Updated/changed MCBSP0DIS (DEVCFG bit) from “ ACLKKO ” to “ ACLKXO ” |
| 46 | Configuration Example F (1 McBSP + HPI + 1 McASP) figure: Updated from MCBSP1DIS = 1 to MCBSP1DIS = 0 |
| 47 | Device Configurations, debugging considerations section: Updated “Internal pullup/pulldown resistors...” paragraph [Revision B] |
| 49 | Terminal Functions, <u>Resets</u> and Interrupts section: Updated IPU/IPD for RESET Signal Name from “IPU” to “—” |
| 50 | Terminal Functions table, Host Port Interface section: Removed “CE1 width 32-bit” from Description for “00” in Bootmode HD[4:3] |
| 50 | Terminal Functions table, Host Port Interface section: Updated “Other HD pins...” paragraph [Revision B] |
| 55 | Terminal Functions, Timer 1 section: Updated Description for TINP1/AHCLKX0 Signal Name |
| 57 | Terminal Functions, Reserved for Test section: Updated Description for RSV Signal Name, 181 PYP, A12 GDP/ZDP Updated Description for RSV Signal Name, 180 PYP, B11 GDP/ZDP |

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

| PAGE(S) NO. | ADDITIONS/CHANGES/DELETIONS |
|----------------|---|
| 57 | Terminal Functions, Reserved for Test section: Updated/changed Description for RSV Signal Name, A12 GDP (to “recommended”) – [Revision A] Updated/changed Description for RSV Signal Name, B11 GDP (to “recommended”) – [Revision A] |
| 57 | Terminal Functions, Reserved for Test section: Updated/changed Description for RSV Signal Name D12 to include PYP 178 as follows: “...the D12/ 178 pin must be externally pulled down with a 10-kΩ resistor.” [Revision B] |
| 66 | Device Support, device and development-support tool nomenclature section: Updated figure for clarity |
| 67 | Device Support, document support section: Updated paragraphs for clarity |
| 92 | Power-Down Mode Logic – Triggering, Wake-up and Effects section: Updated paragraphs [Revision B] |
| 93 | Power-Down Mode Logic – Triggering, Wake-up and Effects section, Characteristics of the Power-Down Modes table: Added “It is recommended to use the PLLPWDN bit (PLLCSR.1) as an alternative to PD3” to PRWD Field (BITS 15–10) – 011100 – Effect on Chip’s Operation [Revision B] |
| 93 | Power-Down Mode Logic – Triggering, Wake-up and Effects section, Characteristics of the Power-Down Modes table: Deleted three paragraphs following table [Revision B] |
| 95 | IEEE 1149.1 JTAG Compatibility Statement section: Updated/added paragraphs for clarity |
| 96 | EMIF Device Speed section, Example Boards and Maximum EMIF Speed table: Type – 3-Loads Short Traces, EMIF Interface Components section: Updated from “32-Bit SDRAMs” to “16-Bit SDRAMs” [Revision B] |
| 95 | IEEE 1149.1 JTAG Compatibility Statement section: Updated/added paragraphs for clarity |
| 99 | Recommended Operating Conditions: Added V _{OS} , Maximum voltage during overshoot row and associated footnote Added V _{US} , Maximum voltage during undershoot row and associated footnote |
| 102 | Parameter Measurement Information, AC transient rise/fall time specifications section: Added AC Transient Specification Rise Time figure Added AC Transient Specification Fall Time figure |
| 124 | MULTICHANNEL AUDIO SERIAL PORT (McASP) TIMING: timing requirements for McASP section: Updated Parameter No. 3, t _c (ACKRX), from “33” to “greater of 2P or 33 ns” and added associated footnote |
| 124 | MULTICHANNEL AUDIO SERIAL PORT (McASP) TIMING: switching characteristics over recommended operating conditions for McASP section: Updated Parameter No. 11, t _c (ACKRX), from “33” to “greater of 2P or 33 ns” and added associated footnote |
| 125, 126 | MULTICHANNEL AUDIO SERIAL PORT (McASP) TIMING section: Updated McASP Input and Output drawings |
| 134 | MULTICHANNEL BUFFERED SERIAL PORT TIMING section: switching characteristics over recommended operating conditions for McBSP section: Updated McBSP Timings figure |
| 147 | Mechanical Data section: Added statement to the Packaging Information section |

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

PYP PowerPAD™ QFP package (top view)

PYP 208-PIN PowerPAD™ PLASTIC QUAD FLATPACK (PQFP) (TOP VIEW)

NOTE: All linear dimensions are in millimeters. This pad is electrically and thermally connected to the backside of the die.
For the TMS320C6713B 208-Pin PowerPAD plastic quad flatpack, the external thermal pad dimensions are: 7.2 x 7.2 mm and the thermal pad is externally flush with the mold compound.

description

The TMS320C67x™ DSPs (including the TMS320C6713B device†) compose the floating-point DSP generation in the TMS320C6000™ DSP platform. The C6713B device is based on the high-performance, advanced very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making this DSP an excellent choice for multichannel and multifunction applications.

Operating at 225 MHz, the C6713B delivers up to 1350 million floating-point operations per second (MFLOPS), 1800 million instructions per second (MIPS), and with dual fixed-/floating-point multipliers up to 450 million multiply-accumulate operations per second (MMACS).

Operating at 300 MHz, the C6713B delivers up to 1800 million floating-point operations per second (MFLOPS), 2400 million instructions per second (MIPS), and with dual fixed-/floating-point multipliers up to 600 million multiply-accumulate operations per second (MMACS).

The C6713B uses a two-level cache-based architecture and has a powerful and diverse set of peripherals. The Level 1 program cache (L1P) is a 4K-byte direct-mapped cache and the Level 1 data cache (L1D) is a 4K-byte 2-way set-associative cache. The Level 2 memory/cache (L2) consists of a 256K-byte memory space that is shared between program and data space. 64K bytes of the 256K bytes in L2 memory can be configured as mapped memory, cache, or combinations of the two. The remaining 192K bytes in L2 serves as mapped SRAM.

The C6713B has a rich peripheral set that includes two Multichannel Audio Serial Ports (McASPs), two Multichannel Buffered Serial Ports (McBSPs), two Inter-Integrated Circuit (I2C) buses, one dedicated General-Purpose Input/Output (GPIO) module, two general-purpose timers, a host-port interface (HPI), and a glueless external memory interface (EMIF) capable of interfacing to SDRAM, SBSRAM, and asynchronous peripherals.

The two McASP interface modules each support one transmit and one receive clock zone. Each of the McASP has eight serial data pins which can be individually allocated to any of the two zones. The serial port supports time-division multiplexing on each pin from 2 to 32 time slots. The C6713B has sufficient bandwidth to support all 16 serial data pins transmitting a 192 kHz stereo signal. Serial data in each zone may be transmitted and received on multiple serial data pins simultaneously and formatted in a multitude of variations on the Philips Inter-IC Sound (I2S) format.

In addition, the McASP transmitter may be programmed to output multiple S/PDIF, IEC60958, AES-3, CP-430 encoded data channels simultaneously, with a single RAM containing the full implementation of user data and channel status fields.

The McASP also provides extensive error-checking and recovery features, such as the bad clock detection circuit for each high-frequency master clock which verifies that the master clock is within a programmed frequency range.

The two I2C ports on the TMS320C6713B allow the DSP to easily control peripheral devices and communicate with a host processor. In addition, the standard multichannel buffered serial port (McBSP) may be used to communicate with serial peripheral interface (SPI) mode peripheral devices.

The TMS320C6713B device has two bootmodes: from the HPI or from external asynchronous ROM. For more detailed information, see the *bootmode* section of this data sheet.

The TMS320C67x DSP generation is supported by the TI eXpressDSP™ set of industry benchmark development tools, including a highly optimizing C/C++ Compiler, the Code Composer Studio™ Integrated Development Environment (IDE), JTAG-based emulation and real-time debugging, and the DSP/BIOS™ kernel.

TMS320C6000, eXpressDSP, Code Composer Studio, and DSP/BIOS are trademarks of Texas Instruments.

† Throughout the remainder of this document, TMS320C6713B shall be referred to as C6713B or 13B.

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

CPU (DSP core) description

The TMS320C6713B floating-point digital signal processor is based on the C67x CPU. The CPU fetches advanced very-long instruction words (VLIW) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the C67x CPU from other VLIW architectures.

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1; the other set contains units .D2, .M2, .S2, and .L2. The two register files each contain 16 32-bit registers for a total of 32 general-purpose registers. The two sets of functional units, along with two register files, compose sides A and B of the CPU (see the functional block and CPU diagram and Figure 1). The four functional units on each side of the CPU can freely share the 16 registers belonging to that side. Additionally, each side features a single data bus connected to all the registers on the other side, by which the two sets of functional units can access data from the register files on the opposite side. While register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle, register access using the register file across the CPU supports one read and one write per cycle.

The C67x CPU executes all C62x instructions. In addition to C62x fixed-point instructions, the six out of eight functional units (.L1, .S1, .M1, .M2, .S2, and .L2) also execute floating-point instructions. The remaining two functional units (.D1 and .D2) also execute the new LDDW instruction which loads 64 bits per CPU side for a total of 128 bits per cycle.

Another key feature of the C67x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The C67x CPU supports a variety of indirect addressing modes using either linear- or circular-addressing modes with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 32 registers. Some registers, however, are singled out to support specific addressing or to hold the condition for conditional instructions (if the condition is not automatically “true”). The two .M functional units are dedicated for multiplies. The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions with results available every clock cycle.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are “linked” together by “1” bits in the least significant bit (LSB) position of the instructions. The instructions that are “chained” together for simultaneous execution (up to eight in total) compose an execute packet. A “0” in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. If an execute packet crosses the fetch-packet boundary (256 bits wide), the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with NOP instructions. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes or half-words as well. All load and store instructions are byte-, half-word, or word-addressable.

CPU (DSP core) description (continued)

† In addition to fixed-point instructions, these functional units execute floating-point instructions.

signal groups description

† These external pins are applicable to the GDP and ZDP packages only.

‡ The GP[15:0] pins, through interrupt sharing, are external interrupt capable via GPINT0. For more details, see the External Interrupt Sources section of this data sheet. For more details on interrupt sharing, see the *TMS320C6000 DSP Interrupt Selector Reference Guide* (literature number SPRU646).

§ All of these pins are external interrupt sources. For more details, see the External Interrupt Sources section of this data sheet.

NOTE A: On multiplexed pins, bolded text denotes the active function of the pin for that particular peripheral module.

DEVICE CONFIGURATIONS

On the C6713B device, bootmode and certain device configurations/peripheral selections are determined at device reset, while other device configurations/peripheral selections are software-configurable via the device configurations register (DEVCFG) [address location 0x019C0200] after device reset.

device configurations at device reset

Table 18 describes the device configuration pins, which are set up via internal or external pullup/pulldown resistors through the HPI data pins (HD[4:3], HD8, HD12), and CLKMODE0 pin. These configuration pins must be in the desired state until reset is released.

For proper device operation, **do not** oppose the HD [13, 11:9, 7, 1, 0] pins with external pull-ups/pulldowns at reset.

For more details on these device configuration pins, see the Terminal Functions table and the Debugging Considerations section of this data sheet.

Table 18. Device Configurations Pins at Device Reset (HD[4:3], HD8, HD12, and CLKMODE0)†

| CONFIGURATION PIN | PYP | GDP/ZDP | FUNCTIONAL DESCRIPTION |
|------------------------|----------|----------|--|
| HD12‡ | 168 | C15 | <p>EMIF Big Endian mode correctness (<u>EMIFBE</u>)</p> <p>For a C6713BGDP or C6713BZDP:</p> <ul style="list-style-type: none"> 0 – The EMIF data will always be presented on the ED[7:0] side of the bus, regardless of the endianness mode (Little/Big Endian). 1 – In Little Endian mode (HD8 =1), the 8-bit or 16-bit EMIF data will be present on the ED[7:0] side of the bus. In Big Endian mode (HD8 =0), the 8-bit or 16-bit EMIF data will be present on the ED[31:24] side of the bus [default]. <p>For a C6713BPYP, when Big Endian mode is selected (LENDIAN = 0), for proper device operation the EMIFBE pin must be externally pulled low.</p> <p>This new functionality does <i>not</i> affect systems using the current default value of HD12=1. For more detailed information on the big endian mode correctness, see the <i>EMIF Big Endian Mode Correctness</i> portion of this data sheet.</p> |
| HD8‡ | 160 | B17 | <p>Device Endian mode (LEND)</p> <ul style="list-style-type: none"> 0 – System operates in Big Endian mode 1 – System operates in Little Endian mode (default) |
| HD[4:3] (BOOTMODE)‡ | 156, 154 | C19, C20 | <p>Bootmode Configuration Pins (BOOTMODE)</p> <ul style="list-style-type: none"> 00 – HPI boot/Emulation boot 01 – <u>CE1</u> width 8-bit, Asynchronous external ROM boot with default timings (default mode) 10 – <u>CE1</u> width 16-bit, Asynchronous external ROM boot with default timings 11 – <u>CE1</u> width 32-bit, Asynchronous external ROM boot with default timings <p>For more detailed information on these bootmode configurations, see the <i>bootmode</i> section of this data sheet.</p> |
| CLKMODE0 | 205 | C4 | <p>Clock generator input clock source select</p> <ul style="list-style-type: none"> 0 – Reserved. Do not use. 1 – CLKIN square wave [default] <p>This pin must be pulled to the correct level even after reset.</p> |

† All other HD pins (HD [15, 13, 11:9, 7:5, 2:0]) have pullups/pulldowns (IPUs or IPDs). For proper device operation, **do not** oppose the HD [13, 11:9, 7, 1, 0] pins with external pull-ups/pulldowns at reset; however, the HD[15, 6, 5, 2] pins *can* be opposed and driven during reset.

‡ IPD = Internal pulldown, IPU = Internal pullup. [To oppose the supply rail on these IPD/IPU signal pins, use external pullup or pulldown resistors no greater than 4.4 kΩ and 2.0 kΩ, respectively.]

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

DEVICE CONFIGURATIONS (CONTINUED)

peripheral pin selection at device reset

Some peripherals share the same pins (internally muxed) and are mutually exclusive (i.e., HPI, general-purpose input/output pins GP[15:8, 3, 1, 0] and McASP1).

- HPI, McASP1, and GPIO peripherals

The HPI_EN (HD14 pin) is latched at reset. This pin selects whether the HPI peripheral pins or McASP1 peripheral pins and GP[15:8, 3, 1, 0] pins are functionally enabled (see Table 19).

Table 19. HPI_EN (HD14 Pin) Peripheral Selection (HPI or McASP1, and Select GPIO Pins)†

| PERIPHERAL PIN SELECTION | PERIPHERAL PINS SELECTED | | DESCRIPTION |
|---------------------------------------|--------------------------|---------------------------|---|
| | HPI | McASP1 and GP[15:8,3,1,0] | |
| HPI_EN (HD14 Pin) [173, C14] 0 | | √ | HPI_EN = 0 HPI pins are disabled; McASP1 peripheral pins and GP[15:8, 3, 1,0] pins are enabled. All multiplexed HPI/McASP1 and HPI/GPIO pins function as McASP1 and GPIO pins, respectively. To use the GPIO pins, the appropriate bits in the GPEN and GPDIR registers need to be configured. |
| 1 | √ | | HPI_EN = 1 HPI pins are enabled; McASP1 peripheral pins and GP[15:8, 3, 1,0] pins are disabled [default]. All multiplexed HPI/McASP1 and HPI/GPIO pins function as HPI pins. |

† The HPI_EN (HD[14]) pin **cannot** be controlled via software.

DEVICE CONFIGURATIONS (CONTINUED)

peripheral selection/device configurations via the DEVCFG control register

The device configuration register (DEVCFG) allows the user to control the pin availability of the McBSP0, McBSP1, McASP0, I2C1, and Timer peripherals. The DEVCFG register also offers the user control of the EMIF input clock source and the timer output pins. For more detailed information on the DEVCFG register control bits, see Table 20 and Table 21.

Table 20. Device Configuration Register (DEVCFG) [Address location: 0x019C0200 – 0x019C02FF]

| R/W-0 | R/W-0 | R/W-0 |
| R/W-0 | R/W-0 | R/W-0 |

Legend: R/W = Read/Write; -n = value after reset
† **Do not** write non-zero values to these bit locations.

Table 21. Device Configuration (DEVCFG) Register Selection Bit Descriptions

| BIT # | NAME | DESCRIPTION |
|-------|-----------|---|
| 31:5 | Reserved | Reserved. Do not write non-zero values to these bit locations. |
| 4 | EKSRC | EMIF input clock source bit. Determines which clock signal is used as the EMIF input clock. 0 = SYSCLK3 (from the clock generator) is the EMIF input clock source (default) 1 = ECLKIN external pin is the EMIF input clock source |
| 3 | TOUT1SEL | Timer 1 output (TOUT1) pin function select bit. Selects the pin function of the TOUT1/AXR0[4] external pin independent of the rest of the peripheral selection bits in the DEVCFG register. 0 = The pin functions as a Timer 1 output (TOUT1) pin (default) 1 = The pin functions as the McASP0 transmit/receive data pin 4 (AXR0[4]). The Timer 1 module is still active. |
| 2 | TOUT0SEL | Timer 0 output (TOUT0) pin function select bit. Selects the pin function of the TOUT0/AXR0[2] external pin independent of the rest of the peripheral selection bits in the DEVCFG register. 0 = The pin functions as a Timer 0 output (TOUT0) pin (default) 1 = The pin functions as the McASP0 transmit/receive data pin 2 (AXR0[2]). The Timer 0 module is still active. |
| 1 | MCBSP0DIS | Multichannel Buffered Serial Port 0 (McBSP0) disable bit. Selects whether McBSP0 or the McASP0 multiplexed peripheral pins are enabled or disabled. 0 = McBSP0 peripheral pins are enabled, McASP0 peripheral pins (AHCLKR0, ACLKR0, ACLKX0, AXR0[0], AXR0[1], AFSR0, and AFSX0) are disabled (default). [If the McASP0 data pins are available, the McASP0 peripheral is functional for DIT mode only.] 1 = McBSP0 peripheral pins are disabled, McASP0 peripheral pins (AHCLKR0, ACLKR0, ACLKX0, AXR0[0], AXR0[1], AFSR0, and AFSX0) are enabled. |
| 0 | MCBSP1DIS | Multichannel Buffered Serial Port 1 (McBSP1) disable bit. Selects whether McBSP1 or I2C1 and McASP0 multiplexed peripheral pins are enabled or disabled. 0 = McBSP1 peripheral pins are enabled, I2C1 peripheral pins (SCL1 and SDA1) and McASP0 peripheral pins (AXR0[7:5] and AMUTE0) are disabled (default) 1 = McBSP1 peripheral pins are disabled, I2C1 peripheral pins (SCL1 and SDA1) and McASP0 peripheral pins (AXR0[7:5] and AMUTE0) are enabled. |

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

DEVICE CONFIGURATIONS (CONTINUED)

multiplexed pins

Multiplexed pins are pins that are shared by more than one peripheral and are internally multiplexed. Most of these pins are configured by software via the device configuration register (DEVCFG), and the others (specifically, the HPI pins) are configured by external pullup/pulldown resistors only at reset. The muxed pins that are configured by software can be programmed to switch functionalities at any time. The muxed pins that are configured by external pullup/pulldown resistors are mutually exclusive; only one peripheral has primary control of the function of these pins after reset. Table 22 summarizes the peripheral pins affected by the HPI_EN (HD14 pin) and DEVCFG register. Table 23 identifies the multiplexed pins on the device; shows the default (primary) function and the default settings after reset; and describes the pins, registers, etc. necessary to configure the specific multiplexed functions.

debugging considerations

It is recommended that external connections be provided to peripheral selection/device configuration pins, including HD[14, 8, 12, 4, 3], and CLKMODE0. Although internal pullup resistors exist on these pins, providing external connectivity adds convenience to the user in debugging and flexibility in switching operating modes.

Internal pullup/pulldown resistors also exist on the non-configuration pins on the HPI data bus and HD[15, 13, 11:9, 7:5, 2:0]. For proper device operation, **do not** oppose the HD [13, 11:9, 7, 1, 0] pins with external pull-ups/pulldowns at reset. If an external controller provides signals to these HD[13, 11:9, 7, 1, 0] non-configuration pins, these signals must be driven to the default state of the pins at reset, or not be driven at all. For a list of routed out, 3-stated, or not-driven pins recommended for *external* pullup/pulldown resistors, and *internal* pullup/pulldown resistors for all device pins, etc., see the Terminal Functions table. However, the HD[15, 6, 5, 2] non-configuration pins *can* be opposed and driven during reset.

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

TERMINAL FUNCTIONS

The terminal functions table identifies the external signal names, the associated pin (ball) numbers along with the mechanical package designator, the pin type (I, O/Z, or I/O/Z), whether the pin has any internal pullup/pulldown resistors and a functional pin description. For more detailed information on device configuration, peripheral selection, multiplexed/shared pins, and debugging considerations, see the Device Configurations section of this data sheet.

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

development support

TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000™ DSP-based applications:

Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE): including Editor

C/C++/Assembly Code Generation, and Debug plus additional development tools

Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any DSP application.

Hardware Development Tools:

Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug)

EVM (Evaluation Module)

For a complete listing of development-support tools for the TMS320C6000™ DSP platform, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

C6000 and XDS are trademarks of Texas Instruments.

device support

device and development-support tool nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS. (e.g., **TMS320C6713BGDP300**). Texas Instruments recommends two of three possible prefix designators for support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

- TMX** Experimental device that is not necessarily representative of the final device's electrical specifications.
- TMP** Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification.
- TMS** Fully qualified production device.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully qualified development-support product.

TMX and TMP devices and TMDX development-support tools are shipped with the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GDP), the temperature range (for example, blank is the default commercial temperature range), and the device speed range in megahertz (for example, -225 is 225 MHz).

The ZDP package, like the GDP package, is a 272-ball plastic BGA *only* with Pb-free balls. For device part numbers and further ordering information for TMS320C6713B in the PYP, GDP and ZDP package types, see the TI website (<http://www.ti.com>) or contact your TI sales representative.

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

device and development-support tool nomenclature (continued)

† BGA = Ball Grid Array
 QFP = Quad Flatpack

‡ The ZDP mechanical package designator represents the version of the GDP with Pb-Free soldered balls. The ZDP package devices are supported in the same speed grades as the GDP package devices (**available upon request**).

§ For actual device part numbers (P/Ns) and ordering information, see the Mechanical Data section of this document or the TI website (www.ti.com).

documentation support

Extensive documentation supports all TMS320™ DSP family generations of devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6000™ DSP devices:

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189) describes the C6000™ CPU (DSP core) architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 DSP Peripherals Overview Reference Guide* [hereafter referred to as the C6000 PRG Overview] (literature number SPRU190) provides an overview and briefly describes the functionality of the peripherals available on the C6000™ DSP platform of devices. This document also includes a table listing the peripherals available on the C6000 devices along with literature numbers and hyperlinks to the associated peripheral documents. These C6713B peripherals are similar to the peripherals on the TMS320C6711 and TMS320C64x devices; therefore, see the TMS320C6711 (C6711 or C67x) peripheral information, and in some cases, where indicated, see the TMS320C6711 (C6711 or C671x) peripheral information and in some cases, where indicated, see the C64x information in the C6000 PRG Overview (literature number SPRU190).

The *TMS320DA6000 DSP Multichannel Audio Serial Port (McASP) Reference Guide* (literature number SPRU041) describes the functionality of the McASP peripherals available on the C6713B device.

TMS320C6000 DSP Software-Programmable Phase-Locked Loop (PLL) Controller Reference Guide (literature number SPRU233) describes the functionality of the PLL peripheral available on the C6713B device.

TMS320C6000 DSP Inter-Integrated Circuit (I2C) Module Reference Guide (literature number SPRU175) describes the functionality of the I2C peripherals available on the C6713B device.

The *PowerPAD Thermally Enhanced Package Technical Brief* (literature number SLMA002) focuses on the specifics of integrating a PowerPAD package into the printed circuit board design to make optimum use of the thermal efficiencies designed into the PowerPAD package.

The *TMS320C6000 Technical Brief* (literature number SPRU197) gives an introduction to the C62x™/C67x™ devices, associated development tools, and third-party support.

The *Migrating from TMS320C6211(B)/C6711(B) to TMS320C6713* application report (literature number SPRA851) indicates the differences and describes the issues of interest related to the migration from the Texas Instruments TMS320C6211(B)/C6711(B), GFN package, to the TMS320C6713, GDP and ZDP packages.

The *TMS320C6713, TMS320C6713B Digital Signal Processors Silicon Errata* (literature number SPRZ191) describes the known exceptions to the functional specifications for particular silicon revisions of the TMS320C6713B device.

The *TMS320C6711D, C6712D, C6713B Power Consumption Summary* application report (literature number SPRA889A2 or later) discusses the power consumption for user applications with the TMS320C6713B, TMS320C6712D, and TMS320C6711D DSP devices.

The *Using IBIS Models for Timing Analysis* application report (literature number SPRA839) describes how to properly use IBIS models to attain accurate timing analysis for a given system.

The tools support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE). For a complete listing of C6000™ DSP latest documentation, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL).

See the Worldwide Web URL for the application report *How To Begin Development Today With the TMS320C6713 Floating-Point DSP* (literature number SPRA809), which describes in more detail the similarities/differences between the C6713 and C6711 C6000™ DSP devices.

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

CPU CSR register description

The CPU control status register (CSR) contains the CPU ID and CPU Revision ID (bits 16–31) as well as the status of the device power-down modes [PWRD field (bits 15–10)], program and data cache control modes, the endian bit (EN, bit 8) and the global interrupt enable (GIE, bit 0) and previous GIE (PGIE, bit 1). Figure 13 and Table 24 identify the bit fields in the CPU CSR register.

For more detailed information on the bit fields in the CPU CSR register, see the *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190) and the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Legend: R = Readable by the MVC instruction, R/W = Readable/Writeable by the MVC instruction; W = Read/write; -n = value after reset, -x = undefined value after reset, C = Clearable by the MVC instruction

Figure 13. CPU Control Status Register (CPU CSR)

CPU CSR register description (continued)

Table 24. CPU CSR Register Bit Field Description

| BIT # | NAME | DESCRIPTION |
|-------|-------------|--|
| 31:24 | CPU ID | CPU ID + REV ID. Read only. Identifies which CPU is used and defines the silicon revision of the CPU. |
| 23:16 | REVISION ID | CPU ID + REVISION ID (31:16) are combined for a value of 0x0203 |
| 15:10 | PWRD | Control power-down modes. The values are always read as zero. 000000 = no power-down (default) 001001 = PD1, wake-up by an enabled interrupt 010001 = PD1, wake-up by an enabled or not enabled interrupt 011010 = PD2, wake-up by a device reset 011100 = PD3, wake-up by a device reset Others = Reserved |
| 9 | SAT | Saturate bit. Set when any unit performs a saturate. This bit can be cleared only by the MVC instruction and can be set only by a functional unit. The set by the a functional unit has priority over a clear (by the MVC instruction) if they occur on the same cycle. The saturate bit is set one full cycle (one delay slot) after a saturate occurs. This bit will not be modified by a conditional instruction whose condition is false. |
| 8 | EN | Endian bit. This bit is read-only. Depicts the device endian mode. 0 = Big Endian mode. 1 = Little Endian mode [default]. |
| 7:5 | PCC | Program Cache control mode. L1D, Level 1 Program Cache 000/010 = Cache Enabled / Cache accessed and updated on reads. All other PCC values reserved. |
| 4:2 | DCC | Data Cache control mode. L1D, Level 1 Data Cache 000/010 = Cache Enabled / 2-Way Cache All other DCC values reserved |
| 1 | PGIE | Previous GIE (global interrupt enable); saves the Global Interrupt Enable (GIE) when an interrupt is taken. Allows for proper nesting of interrupts. 0 = Previous GIE value is 0. (default) 1 = Previous GIE value is 1. |
| 0 | GIE | Global interrupt enable bit. Enables (1) or disables (0) all interrupts except the reset interrupt and NMI (nonmaskable interrupt). 0 = Disables all interrupts (except the reset interrupt and NMI) [default] 1 = Enables all interrupts (except the reset interrupt and NMI) |

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

cache configuration (CCFG) register description

The C6713B device includes an enhancement to the cache configuration (CCFG) register. A “P” bit (CCFG.31) allows the programmer to select the priority of accesses to L2 memory originating from the transfer crossbar (TC) over accesses originating from the L1D memory system. An important class of TC accesses is EDMA transfers, which move data to or from the L2 memory. While the EDMA normally has no issue accessing L2 memory due to the high hit rates on the L1D memory system, there are pathological cases where certain CPU behavior could block the EDMA from accessing the L2 memory for long enough to cause a missed deadline when transferring data to a peripheral such as the McASP or McBSP. This can be avoided by setting the P bit to “1” because the EDMA will assume a higher priority than the L1D memory system when accessing L2 memory.

For more detailed information on the P-bit function and for silicon advisories concerning EDMA L2 memory accesses blocked, see the *TMS320C6713, TMS320C6713B Digital Signal Processors Silicon Errata* (literature number SPRZ191).

† This device includes a P bit.

Figure 14. Cache Configuration Register (CCFG)

Table 25. CCFG Register Bit Field Description

| BIT # | NAME | DESCRIPTION |
|-------|----------|---|
| 31 | P | L1D requestor priority to L2 bit. P = 0: L1D requests to L2 higher priority than TC requests P = 1: TC requests to L2 higher priority than L1D requests |
| 30:10 | Reserved | Reserved. Read-only, writes have no effect. |
| 9 | IP | Invalidate L1P bit. 0 = Normal L1P operation 1 = All L1P lines are invalidated |
| 8 | ID | Invalidate L1D bit. 0 = Normal L1D operation 1 = All L1D lines are invalidated |
| 7:3 | Reserved | Reserved. Read-only, writes have no effect. |
| 2:0 | L2MODE | L2 operation mode bits (L2MODE). 000b = L2 Cache disabled (All SRAM mode) [256K SRAM] 001b = 1-way Cache (16K L2 Cache) / [240K SRAM] 010b = 2-way Cache (32K L2 Cache) / [224K SRAM] 011b = 3-way Cache (48K L2 Cache) / [208K SRAM] 111b = 4-way Cache (64K L2 Cache) / [192K SRAM] All others Reserved |

interrupts and interrupt selector

The C67x DSP core supports 16 prioritized interrupts, which are listed in Table 26. The highest priority interrupt is INT_00 (dedicated to RESET) while the lowest priority is INT_15. The first four interrupts are non-maskable and fixed. The remaining interrupts (4–15) are maskable and default to the interrupt source listed in Table 26. However, their interrupt source may be reprogrammed to any one of the sources listed in Table 27 (Interrupt Selector). Table 27 lists the selector value corresponding to each of the alternate interrupt sources. The selector choice for interrupts 4–15 is made by programming the corresponding fields (listed in Table 26) in the MUXH (address 0x019C0000) and MUXL (address 0x019C0004) registers.

† Interrupt Events GPINT4, GPINT5, GPINT6, and GPINT7 are outputs from the GPIO module (GP). They originate from the device pins GP[4](EXT_INT4)/AMUTEIN1, GP[5](EXT_INT5)/AMUTEIN0, GP[6](EXT_INT6), and GP[7](EXT_INT7). These pins can be used as edge-sensitive EXT_INTx with polarity controlled by the External Interrupt Polarity Register (EXTPOL.[3:0]). The corresponding pins must first be *enabled* in the GPIO module by setting the corresponding enable bits in the GP Enable Register (GPEN.[7:4]), and configuring them as *inputs* in the GP Direction Register (GPDIR.[7:4]). These interrupts can be controlled through the GPIO module in addition to the simple EXTPO.[3:0] bits. For more information on interrupt control via the GPIO module, see the *TMS320C6000 DSP General-Purpose Input/Output (GPIO) Reference Guide* (literature number SPRU584).

external interrupt sources

The device supports many external interrupt sources as indicated in Table 28. Control of the interrupt source is done by the associated module and is made available by enabling the corresponding binary interrupt selector value (see Table 27 Interrupt Selector shaded rows). Due to pin muxing and module usage, not all external interrupt sources are available at the same time.

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

EDMA module and EDMA selector

The C67x EDMA supports up to 16 EDMA channels. Four of the sixteen channels (channels 8–11) are reserved for EDMA chaining, leaving 12 EDMA channels available to service peripheral devices.

The EDMA selector registers that control the EDMA channels servicing peripheral devices are located at addresses 0x01A0FF00 (ESEL0), 0x01A0FF04 (ESEL1), and 0x01A0FF0C (ESEL3). These EDMA selector registers control the mapping of the EDMA events to the EDMA channels. Each EDMA event has an assigned EDMA selector code (see Table 30). By loading each EVTSELx register field with an EDMA selector code, users can map any desired EDMA event to any specified EDMA channel. Table 29 lists the default EDMA selector value for each EDMA channel.

See Table 31 and Table 32 for the EDMA Event Selector registers and their associated bit descriptions.

Table 32. EDMA Event Selection Registers (ESEL0, ESEL1, and ESEL3) Description

| BIT # | NAME | DESCRIPTION |
|--------------------------------|----------|---|
| 31:30 23:22 15:14 7:6 | Reserved | Reserved. Read-only, writes have no effect. |
| 29:24 21:16 13:8 5:0 | EVTSELx | EDMA event selection bits for channel x. Allows mapping of the EDMA events to the EDMA channels. The EVTSEL0 through EVTSEL15 bits correspond to the channels 0 to 15, respectively. These EVTSELx fields are user-selectable. By configuring the EVTSELx fields to the EDMA selector value of the desired EDMA sync event number (see Table 30), users can map any EDMA event to the EDMA channel. For example, if EVTSEL15 is programmed to 00 0001b (the EDMA selector code for TINT0), then channel 15 is triggered by Timer0 TINT0 events. |

PLL and PLL controller

The TMS320C6713B includes a PLL and a flexible PLL Controller peripheral consisting of a prescaler (D0) and four dividers (OSCDIV1, D1, D2, and D3). The PLL controller is able to generate different clocks for different parts of the system (i.e., DSP core, Peripheral Data Bus, External Memory Interface, McASP, and other peripherals). Figure 15 illustrates the PLL, the PLL controller, and the clock generator logic.

† Dividers D1 and D2 must never be disabled. Never write a “0” to the D1EN or D2EN bits in the PLLDIV1 and PLLDIV2 registers.

- NOTES:
- A. Place all PLL external components (C1, C2, and the EMI Filter) as close to the C67x™ DSP device as possible. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown.
 - B. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (C1, C2, and the EMI Filter).
 - C. The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV_{DD}.
 - D. EMI filter manufacturer TDK part number ACF451832-333, -223, -153, -103. Panasonic part number EXCET103U.

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

PLL and PLL controller (continued)

The PLL Reset Time is the amount of wait time needed when resetting the PLL (writing PLLRST=1), in order for the PLL to properly reset, before bringing the PLL out of reset (writing PLLRST = 0). For the PLL Reset Time value, see Table 33. The PLL Lock Time is the amount of time from when PLLRST = 0 with PLEN = 0 (PLL out of reset, but still bypassed) to when the PLEN bit can be safely changed to “1” (switching from bypass to the PLL path), see Table 33 and Figure 15.

Under some operating conditions, the maximum PLL Lock Time may vary from the specified typical value. For the PLL Lock Time values, see Table 33.

Table 33. PLL Lock and Reset Times

| | MIN | TYP | MAX | UNIT |
|----------------|-----|-----|-------|------|
| PLL Lock Time | | 75 | 187.5 | μs |
| PLL Reset Time | 125 | | | ns |

Table 34 shows the device’s CLKOUT signals, how they are derived and by what register control bits, and what is the default settings. For more details on the PLL, see the PLL and Clock Generator Logic diagram (Figure 15).

Table 34. CLKOUT Signals, Default Settings, and Control

| CLOCK OUTPUT SIGNAL NAME | DEFAULT SETTING (ENABLED or DISABLED) | CONTROL BIT(s) (Register) | DESCRIPTION |
|--------------------------|---------------------------------------|--|---|
| CLKOUT2 | ON (ENABLED) | D2EN = 1 (PLLDIV2.[15]) CK2EN = 1 (EMIF GBLCTL.[3]) | SYSCLK2 selected [default] |
| CLKOUT3 | ON (ENABLED) | OD1EN = 1 (OSCDIV1.[15]) | Derived from CLKIN |
| ECLKOUT | ON (ENABLED); derived from SYSCLK3 | EKSRC = 0 (DEVCFG.[4]) EKEN = 1 (EMIF GBLCTL.[5]) | SYSCLK3 selected [default]. To select ECLKIN source: EKSRC = 1 (DEVCFG.[4]) and EKEN = 1 (EMIF GBLCTL.[5]) |

The input clock (CLKIN) is directly available to the McASP modules as AUXCLK for use as an internal high-frequency clock source. The input clock (CLKIN) may also be divided down by a programmable divider OSCDIV1 (/1, /2, /3, ..., /32) and output on the CLKOUT3 pin for other use in the system.

Figure 15 shows that the input clock source may be divided down by divider PLLDIV0 (/1, /2, ..., /32) and then multiplied up by a factor of x4, x5, x6, and so on, up to x25.

Either the input clock (PLEN = 0) or the PLL output (PLEN = 1) then serves as the high-frequency reference clock for the rest of the DSP system. The DSP core clock, the peripheral bus clock, and the EMIF clock may be divided down from this high-frequency clock (each with a unique divider) . For example, with a 30 MHz input if the PLL output is configured for 450 MHz, the DSP core may be operated at 225 MHz (/2) while the EMIF may be configured to operate at a rate of 75 MHz (/6). Note that there is a specific minimum and maximum reference clock (PLLREF) and output clock (PLLOUT) for the block labeled PLL in Figure 15, as well as for the DSP core, peripheral bus, and EMIF. The clock generator must not be configured to exceed any of these constraints (certain combinations of external clock input, internal dividers, and PLL multiply ratios might not be supported). See Table 35 for the PLL clocks input and output frequency ranges.

PLL and PLL controller (continued)

Table 35. PLL Clock Frequency Ranges†‡

| CLOCK SIGNAL | PYP –200, –225 GDP/ZDP –225, –300 PYPA –167, –200 GDPA/ZDPA –200 | | UNIT |
|---------------------|---|-------------------------|------|
| | MIN | MAX | |
| PLLREF (PLLEN = 1) | 12 | 100 | MHz |
| PLLOUT | 140 | 600 | MHz |
| SYSCLK1 | – | Device Speed (DSP Core) | MHz |
| SYSCLK3 (EKSRC = 0) | – | 100 | MHz |
| AUXCLK | – | 50§ | MHz |

† SYSCLK2 rate **must** be exactly half of SYSCLK1.

‡ Also see the electrical specification (timing requirements and switching characteristics parameters) in the input and output clocks section of this data sheet.

§ When the McASP module is *not* used, the AUXCLK maximum frequency can be any frequency up to the CLKIN maximum frequency.

The EMIF itself may be clocked by an external reference clock via the ECLKIN pin or can be generated on-chip as SYSCLK3. SYSCLK3 is derived from divider D3 off of PLLOUT (see Figure 15, PLL and Clock Generator Logic). The EMIF clock selection is programmable via the EKSRC bit in the DEVCFG register.

The settings for the PLL multiplier and each of the dividers in the clock generation block may be reconfigured via software at run time. If either the input to the PLL changes due to D0, CLKMODE0, or CLKIN, or if the PLL multiplier is changed, then software must enter bypass first and stay in bypass until the PLL has had enough time to lock (see electrical specifications). For the programming procedure, see the *TMS320C6000 DSP Software-Programmable Phase-Locked Loop (PLL) Controller Reference Guide* (literature number SPRU233).

SYSCLK2 is the internal clock source for peripheral bus control. SYSCLK2 (Divider D2) **must** be programmed to be half of the SYSCLK1 rate. For example, if D1 is configured to divide-by-2 mode (/2), then D2 **must** be programmed to divide-by-4 mode (/4). SYSCLK2 is also tied directly to CLKOUT2 pin (see Figure 15).

During the programming transition of Divider D1 and Divider D2 (resulting in SYSCLK1 and SYSCLK2 output clocks, see Figure 15), the order of programming the PLLDIV1 and PLLDIV2 registers must be observed to ensure that SYSCLK2 always runs at half the SYSCLK1 rate or slower. For example, if the divider ratios of D1 and D2 are to be changed from /1, /2 (respectively) to /5, /10 (respectively) then, the PLLDIV2 register must be programmed before the PLLDIV1 register. The transition ratios become /1, /2; /1, /10; and then /5, /10. If the divider ratios of D1 and D2 are to be changed from /3, /6 to /1, /2 then, the PLLDIV1 register must be programmed before the PLLDIV2 register. The transition ratios, for this case, become /3, /6; /1, /6; and then /1, /2. The final SYSCLK2 rate **must** be exactly half of the SYSCLK1 rate.

Note that Divider D1 and Divider D2 must **always** be enabled (i. e., D1EN and D2EN bits are set to “1” in the PLLDIV1 and PLLDIV2 registers).

The PLL Controller registers should be modified only by the CPU or via emulation. The HPI should **not** be used to directly access the PLL Controller registers.

For detailed information on the clock generator (PLL Controller registers) and their associated software bit descriptions, see Table 37 through Table 43.

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

multichannel audio serial port (McASP) peripherals

The device includes two multi-channel audio serial port (McASP) interface peripherals (McASP1 and McASP0). The McASP is a serial port optimized for the needs of multi-channel audio applications. With two McASP peripherals, the device is capable of supporting two completely independent audio zones simultaneously.

Each McASP consists of a transmit and receive section. These sections can operate completely independently with different data formats, separate master clocks, bit clocks, and frame syncs or alternatively, the transmit and receive sections may be synchronized. Each McASP module also includes a pool of 16 shift registers that may be configured to operate as either transmit data, receive data, or general-purpose I/O (GPIO).

The transmit section of the McASP can transmit data in either a time-division-multiplexed (TDM) synchronous serial format or in a digital audio interface (DIT) format where the bit stream is encoded for S/PDIF, AES-3, IEC-60958, CP-430 transmission. The receive section of the McASP supports the TDM synchronous serial format.

Each McASP can support one transmit data format (either a TDM format or DIT format) and one receive format at a time. All transmit shift registers use the same format and all receive shift registers use the same format. However, the transmit and receive formats need not be the same.

Both the transmit and receive sections of the McASP also support burst mode which is useful for non-audio data (for example, passing control information between two DSPs).

The McASP peripherals have additional capability for flexible clock generation, and error detection/handling, as well as error management.

McASP block diagram

Figure 16 illustrates the major blocks along with external signals of the McASP1 and McASP0 peripherals; and shows the 8 serial data [AXR] pins for each McASP. Each McASP also includes full general-purpose I/O (GPIO) control, so any pins not needed for serial transfers can be used for general-purpose I/O.

Figure 16. McASP0 and McASP1 Configuration

TMS320C6713B

FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

multichannel audio serial port (McASP) peripherals (continued)

multichannel time division multiplexed (TDM) synchronous transfer mode

The McASP supports a multichannel, time-division-multiplexed (TDM) synchronous transfer mode for both transmit and receive. Within this transfer mode, a wide variety of serial data formats are supported, including formats compatible with devices using the Inter-Integrated Sound (IIS) protocol.

TDM synchronous transfer mode is typically used when communicating between integrated circuits such as between a DSP and one or more ADC, DAC, CODEC, or S/PDIF receiver devices. In multichannel applications, it is typical to find several devices operating synchronized with each other. For example, to provide six analog outputs, three stereo DAC devices would be driven with the same bit clock and frame sync, but each stereo DAC would use a different McASP serial data pin carrying stereo data (2 TDM time slots, left and right).

The TDM synchronous serial transfer mode utilizes several control signals and one or more serial data signals:

- A bit clock signal (ACLKX for transmit, ACKLR for receive)
- A frame sync signal (AFSX for transmit, AFSR for receive)
- An (Optional) high frequency master clock (AHCLKX for transmit, AHCLKR for receive) from which the bit clock is derived
- One or more serial data pins (AXR for transmit and for receive).

Except for the optional high-frequency master clock, all of the signals in the TDM synchronous serial transfer mode protocol are synchronous to the bit clocks (ACLKX and ACKLR).

In the TDM synchronous transfer mode, the McASP continually transmits and receives data periodically (since audio ADCs and DACs operate at a fixed-data rate). The data is organized into frames, and the beginning of a frame is marked by a frame sync pulse on the AFSX, AFSR pin.

In a typical audio system, one frame is transferred per sample period. To support multiple channels, the choices are to either include more time slots per frame (and therefore operate with a higher bit clock) or to keep the bit clock period constant and use additional data pins to transfer the same number of channels. For example, a particular six-channel DAC might require three McASP serial data pins; transferring two channels of data on each serial data pin during each sample period (frame). Another similar DAC may be designed to use only a single McASP serial data pin, but clocked three times faster and transferring six channels of data per sample period. The McASP is flexible enough to support either type of DAC but a transmitter cannot be configured to do both at the same time.

For multiprocessor applications, the McASP supports any number of time slots per frame (between 2 and 32), and includes the ability to “disable” transfers during specific time slots.

In addition, to support of S/PDIF, AES-3, IEC-60958, CP-430 receivers chips whose natural block (McASP frame) size is 384 samples; the McASP receiver supports a 384 time slot mode. The advantage to using the 384 time slot mode is that interrupts may be generated synchronous to the S/PDIF, AES-3, IEC-60958, CP-430 receivers, for example the “last slot” interrupt.

burst transfer mode

The McASP also supports a burst transfer mode, which is useful for non-audio data (for example, passing control information between two DSPs). Burst transfer mode uses a synchronous serial format similar to TDM, except the frame sync is generated for each data word transferred. In addition, frame sync generation is not periodic or time-driven as in TDM mode but rather data-driven.

multichannel audio serial port (McASP) peripherals (continued)

supported bit stream formats for TDM and burst transfer modes

The serial data pins support a wide variety of formats. In the TDM and burst synchronous modes, the data may be transmitted / received with the following options:

- Time slots per frame: 1 (Burst/Data Driven), or 2,3...32 (TDM/Time-Driven).
- Time slot size: 8, 12, 16, 20, 24, 28, 32 bits per time slot
- Data size: 8, 12, 16, 20, 24, 28, 32 bits (must be less than or equal to time slot)
- Data alignment within time slot: Left- or Right-Justified
- Bit order: MSB or LSB first.
- Unused bits in time slot: Padded with 0, 1 or extended with value of another bit.
- Time slot delay from frame sync: 0,1, or 2 bit delay

The data format can be programmed independently for transmit and receive, and for McASP0 vs. McASP1. In addition, the McASP can automatically re-align the data as processed natively by the DSP (any format on a nibble boundary) adjusting the data in hardware to any of the supported serial bit stream formats (TDM, Burst, and DIT modes). This reduces the amount of bit manipulation that the DSP must perform and simplifies software architecture.

digital audio interface transmitter (DIT) transfer mode (transmitter only)

The McASP transmit section may also be configured in digital audio interface transmitter (DIT) mode where it outputs data formatted for transmission over an S/PDIF, AES-3, IEC-60958, or CP-430 standard link. These standards encode the serial data such that the equivalent of 'clock' and 'frame sync' are embedded within the data stream. DIT transfer mode is used as an interconnect between audio components and can transfer multichannel digital audio data over a single optical or coaxial cable.

From an internal DSP standpoint, the McASP operation in DIT transfer mode is similar to the two time slot TDM mode, but the data transmitted is output as a bi-phase mark encoded bit stream with preamble, channel status, user data, validity, and parity automatically stuffed into the bit stream by the McASP module. The McASP includes separate validity bits for even/odd subframes and two 384-bit register file modules to hold channel status and user data bits.

DIT mode requires at minimum:

- One serial data pin (if the AUXCLK is used as the reference [see the PLL and Clock Generator Logic Figure 15]) or
- One serial data pin plus either the AHCLKX or ACLKX pin (if an external clock is needed).

If additional serial data pins are used, each McASP may be used to transmit multiple encoded bit streams (one per pin). However, the bit streams will all be synchronized to the same clock and the user data, channel status, and validity information carried by each bit stream will be the same for all bit streams transmitted by the same McASP module.

The McASP can also automatically re-align the data as processed by the DSP (any format on a nibble boundary) in DIT mode; reducing the amount of bit manipulation that the DSP must perform and simplifies software architecture.

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

multichannel audio serial port (McASP) peripherals (continued)

McASP flexible clock generators

The McASP transmit and receive clock generators are identical. Each clock generator can accept a high-frequency master clock input (on the AHCLKX and AHCLKR pins).

The transmit and receive bit clocks (on the ACLKX and ACLKR pins) can also be sourced externally or can be sourced internally by dividing down the high-frequency master clock input (programmable factor /1, /2, /3, ... /4096). The polarity of each bit clock is individually programmable.

The frame sync pins are AFSX (transmit) and AFSR (receive). A typical usage for these pins is to carry the left-right clock (LRCLK) signal when transmitting and receiving stereo data. The frame sync signals are individually programmable for either internal or external generation, either bit or slot length, and either rising or falling edge polarity.

Some examples of the things that a system designer can use the McASP clocking flexibility for are:

- Input a high-frequency master clock (for example, $512f_s$ of the receiver), receive with an internally generated bit clock ratio of /8, while transmitting with an internally generated bit clock ratio of /4 or /2. [An example application would be to receive data from a DVD at 48 kHz but output up-sampled or decoded audio at 96 kHz or 192 kHz.]
- Transmit/receive data based one sample rate (for example, 44.1 kHz) using McASP0 while transmitting and receiving at a different sample rate (for example, 48 kHz) on McASP1.
- Use the DSP's on-board AUXCLK to supply the system clock when the input source is an A/D converter.

McASP error handling and management

To support the design of a robust audio system, the McASP module includes error-checking capability for the serial protocol, data underrun, and data overrun. In addition, each McASP includes a timer that continually measures the high-frequency master clock every 32-SYSCLOCK2 clock cycles. The timer value can be read to get a measurement of the high-frequency master clock frequency and has a min-max range setting that can raise an error flag if the high-frequency master clock goes out of a specified range. The user would read the high-frequency transmit master clock measurement (AHCLKX0 or AHCLKX1) by reading the XCNT field of the XCLKCHK register and the user would read the high-frequency receive master clock measurement (AHCLKR0 or AHCLKR1) by reading the RCNT field of the RCLKCHK register.

Upon the detection of any one or more of the above errors (software selectable), or the assertion of the AMUTE_IN pin, the AMUTE output pin may be asserted to a high or low level (selectable) to immediately mute the audio output. In addition, an interrupt may be generated if enabled based on any one or more of the error sources.

McASP interrupts and EDMA events

The McASP transmitter and receiver sections each generate an event on every time slot. This event can be serviced by an interrupt or by the EDMA controller.

When using interrupts to service the McASP, each shift register buffer has a unique address in the McASP Registers space (see Table 3).

When using the EDMA to service the McASP, the McASP DATA Port space in Table 3 is accessed. In this case, the address least-significant bits are ignored. Writes to any address in this range access the transmitting buffers in order from lowest (serializer 0) to highest (serializer 15), skipping over disabled and receiving serializers. Likewise, reads from any address in this space access the receiving buffers in the same order but skip over disabled and transmitting buffers.

I2C

Having two I2C modules on the TMS320C6713B simplifies system architecture, since one module may be used by the DSP to control local peripherals ICs (DACs, ADCs, etc.) while the other may be used to communicate with other controllers in a system or to implement a user interface.

The TMS320C6713B also includes two I2C serial ports for control purposes. Each I2C port supports:

- Compatible with *Philips I²C Specification Revision 2.1* (January 2000)
- Fast Mode up to 400 Kbps (no fail-safe I/O buffers)
- Noise Filter to Remove Noise 50 ns or less
- Seven- and Ten-Bit Device Addressing Modes
- Master (Transmit/Receive) and Slave (Transmit/Receive) Functionality
- Events: DMA, Interrupt, or Polling
- Slew-Rate Limited Open-Drain Output Buffers

Figure 17 is a block diagram of the I2Cx module.

NOTE A: Shading denotes control/status registers.

Figure 17. I2Cx Module Block Diagram

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

general-purpose input/output (GPIO)

To use the GP[15:0] software-configurable GPIO pins, the GPxEN bits in the GP Enable (GPEN) Register and the GPxDIR bits in the GP Direction (GPDIR) Register must be properly configured.

GPxEN = 1 GP[x] pin is enabled

GPxDIR = 0 GP[x] pin is an input

GPxDIR = 1 GP[x] pin is an output

where “x” represents one of the 15 through 0 GPIO pins

Figure 18 shows the GPIO enable bits in the GPEN register for the C6713B device. To use any of the GPx pins as general-purpose input/output functions, the corresponding GPxEN bit must be set to “1” (enabled). Default values are device-specific, so refer to Figure 18 for the C6713B default configuration.

Legend: R/W = Readable/Writeable; -n = value after reset, -x = undefined value after reset

Figure 18. GPIO Enable Register (GPEN) [Hex Address: 01B0 0000]

Figure 19 shows the GPIO direction bits in the GPDIR register. This register determines if a given GPIO pin is an input or an output providing the corresponding GPxEN bit is enabled (set to “1”) in the GPEN register. By default, all the GPIO pins are configured as input pins.

Legend: R/W = Readable/Writeable; -n = value after reset, -x = undefined value after reset

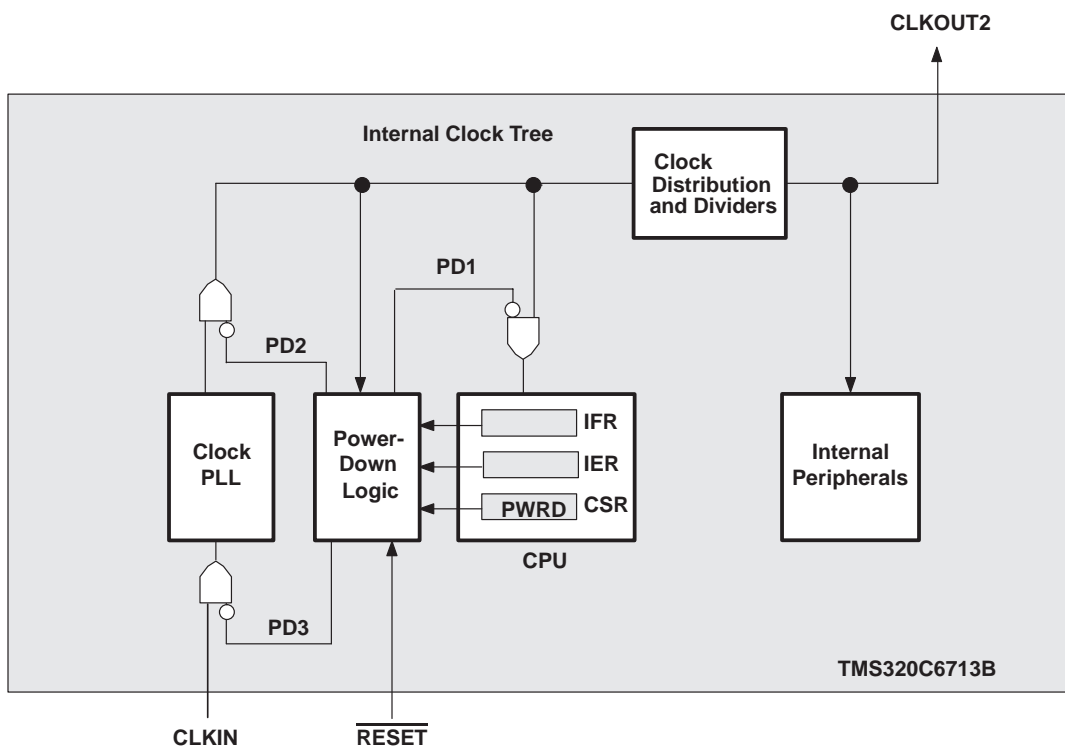

Figure 19. GPIO Direction Register (GPDIR) [Hex Address: 01B0 0004]

For more detailed information on general-purpose inputs/outputs (GPIOs), see the *TMS320C6000 DSP General-Purpose Input/Output (GPIO) Reference Guide* (literature number SPRU584).

power-down mode logic

Figure 20 shows the power-down mode logic on the C6713B.

† External input clocks, with the exception of CLKIN and CLKOUT3, are *not* gated by the power-down mode logic.

Figure 20. Power-Down Mode Logic†

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

triggering, wake-up, and effects

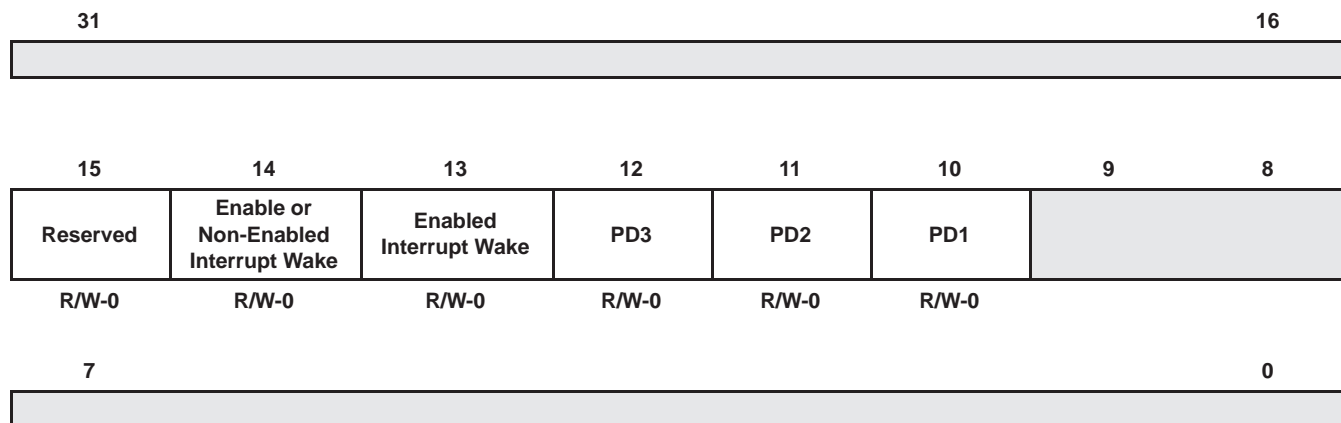

The device includes a programmable PLL which allows software control of PLL bypass via the PLEN bit in the PLLCSR register. With this enhanced functionality come some additional considerations when entering power-down modes.

The power-down modes (PD2 and PD3) function by disabling the PLL to stop clocks to the C6713 device. However, if the PLL is bypassed (PLEN = 0), the device will still receive clocks from the external clock input (CLKIN). Therefore, bypassing the PLL makes the power-down modes PD2 and PD3 ineffective.

The PLL needs to be enabled by writing a “1” to PLEN bit (PLLCSR.0) before being able to enter either PD3 (CSR.11) or PD2 (CSR.10) in order for these modes to have an effect.

For the TMS320C6713B device it is recommended to use the PLLPWDN bit (PLLCSR.1) to enter a deep power-down state equivalent to PD3 since the PLLPWDN bit takes full advantage of the PLL power-down feature.

The power-down modes (PD1, PD2, and PD3) and their wake-up methods are programmed by setting the PWRD field (bits 15–10) of the control status register (CSR). The PWRD field of the CSR is shown in Figure 21 and described in Table 44. When writing to the CSR, all bits of the PWRD field should be set at the same time. Logic 0 should be used when “writing” to the reserved bit (bit 15) of the PWRD field. The CSR is discussed in detail in the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Legend: R/W-x = Read/write reset value

NOTE: The shadowed bits are not part of the power-down logic discussion and therefore are not covered here. For information on these other bit fields in the CSR register, see the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Figure 21. PWRD Field of the CSR Register

A delay of up to nine clock cycles may occur after the instruction that sets the PWRD bits in the CSR before the PD mode takes effect. As best practice, NOPs should be padded after the PWRD bits are set in the CSR to account for this delay.

If PD1 mode is terminated by a non-enabled interrupt, the program execution returns to the instruction where PD1 took effect. If PD1 mode is terminated by an enabled interrupt, the interrupt service routine will be executed first, then the program execution returns to the instruction where PD1 took effect. In the case with an enabled interrupt,

the GIE bit in the CSR and the NMIE bit in the interrupt enable register (IER) must also be set in order for the interrupt service routine to execute; otherwise, execution returns to the instruction where PD1 took effect upon PD1 mode termination by an enabled interrupt.

PD2 and PD3 modes can only be aborted by device reset. Table 44 summarizes all the power-down modes.

Table 44. Characteristics of the Power-Down Modes

| PRWD FIELD (BITS 15–10) | POWER-DOWN MODE | WAKE-UP METHOD | EFFECT ON CHIP'S OPERATION |
|-------------------------|------------------|---|--|
| 000000 | No power-down | — | — |
| 001001 | PD1 | Wake by an enabled interrupt | CPU halted (except for the interrupt logic) Power-down mode blocks the internal clock inputs at the boundary of the CPU, preventing most of the CPU's logic from switching. During PD1, EDMA transactions can proceed between peripherals and internal memory. |
| 010001 | PD1 | Wake by an enabled or non-enabled interrupt | |
| 011010 | PD2 [†] | Wake by a device reset | Output clock from PLL is halted, stopping the internal clock structure from switching and resulting in the entire chip being halted. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off. |
| 011100 | PD3 [†] | Wake by a device reset | Input clock to the PLL stops generating clocks. All register and internal RAM contents are preserved. All functional I/O freeze in the last state when the PLL clock is turned off. Following reset, the PLL needs time to re-lock, just as it does following power-up. Wake-up from PD3 takes longer than wake-up from PD2 because the PLL needs to be re-locked, just as it does following power-up. It is recommended to use the PLLPWDN bit (PLLCR.1) as an alternative to PD3. |
| All others | Reserved | — | — |

[†] When entering PD2 and PD3, all functional I/O remains in the previous state. However, for peripherals which are asynchronous in nature or peripherals with an external clock source, output signals may transition in response to stimulus on the inputs. Under these conditions, peripherals will not operate according to specifications.

power-supply sequencing

TI DSPs do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that neither supply is powered up for extended periods of time (>1 second) if the other supply is below the proper operating voltage.

system-level design considerations

System-level design considerations, such as bus contention, may require supply sequencing to be implemented. In this case, the core supply should be powered up prior to (and powered down after), the I/O buffers. This is to ensure that the I/O buffers receive valid inputs from the core before the output buffers are powered up, thus, preventing bus contention with other chips on the board.

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

power-supply design considerations

A dual-power supply with simultaneous sequencing can be used to eliminate the delay between core and I/O power up. A Schottky diode can also be used to tie the core rail to the I/O rail (see Figure 22).

Figure 22. Schottky Diode Diagram

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000™ platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

power-supply decoupling

In order to properly decouple the supply planes from system noise, place as many capacitors (caps) as possible close to the DSP. Assuming 0603 caps, the user should be able to fit a total of 60 caps — 30 for the core supply and 30 for the I/O supply. These caps need to be close (no more than 1.25 cm maximum distance) to the DSP to be effective. Physically smaller caps are better, such as 0402, but the size needs to be evaluated from a yield/manufacturing point-of-view. Parasitic inductance limits the effectiveness of the decoupling capacitors, therefore physically smaller capacitors should be used while maintaining the largest available capacitance value. As with the selection of any component, verification of capacitor availability over the product's production lifetime needs to be considered.

IEEE 1149.1 JTAG compatibility statement

The TMS320C6713B DSP requires that both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ resets be asserted upon power up to be properly initialized. While $\overline{\text{RESET}}$ initializes the DSP core, $\overline{\text{TRST}}$ initializes the DSP's emulation logic. Both resets are required for proper operation.

Note: $\overline{\text{TRST}}$ is synchronous and **must** be clocked by TCLK ; otherwise, BSCAN may not respond as expected after $\overline{\text{TRST}}$ is asserted.

While both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ need to be asserted upon power up, only $\overline{\text{RESET}}$ needs to be released for the DSP to boot properly. $\overline{\text{TRST}}$ may be asserted indefinitely for normal operation, keeping the JTAG port interface and DSP's emulation logic in the reset state. $\overline{\text{TRST}}$ only needs to be released when it is necessary to use a JTAG controller to debug the DSP or exercise the DSP's boundary scan functionality.

The TMS320C6713B DSP includes an internal pulldown (IPD) on the $\overline{\text{TRST}}$ pin to ensure that $\overline{\text{TRST}}$ will always be asserted upon power up and the DSP's internal emulation logic will always be properly initialized when this pin is not routed out. JTAG controllers from Texas Instruments actively drive $\overline{\text{TRST}}$ high. However, some third-party JTAG controllers may not drive $\overline{\text{TRST}}$ high but expect the use of an external pullup resistor on $\overline{\text{TRST}}$. When using this type of JTAG controller, assert $\overline{\text{TRST}}$ to initialize the DSP after powerup and externally drive $\overline{\text{TRST}}$ high before attempting any emulation or boundary scan operations.

Following the release of $\overline{\text{RESET}}$, the low-to-high transition of $\overline{\text{TRST}}$ must be "seen" to latch the state of EMU1 and EMU0. The EMU[1:0] pins configure the device for either Boundary Scan mode or Emulation mode. For more detailed information, see the terminal functions section of this data sheet.

Note: The DESIGN-WARNING section of the TMS320C6713B BSDL file contains information and constraints regarding proper device operation while in Boundary Scan Mode.

For more detailed information on the C6713B JTAG emulation, see the *TMS320C6000 DSP Designing for JTAG Emulation Reference Guide* (literature number SPRU641).

EMIF device speed

The maximum EMIF speed on the C6713B device is 100 MHz. TI recommends utilizing I/O buffer information specification (IBIS) to analyze all AC timings to determine if the maximum EMIF speed is achievable for a given board layout. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839).

For ease of design evaluation, Table 45 contains IBIS simulation results showing the maximum EMIF-SDRAM interface speeds for the given example boards (TYPE) and SDRAM speed grades. Timing analysis should be performed to verify that all AC timings are met for the specified board layout. Other configurations are also possible, but again, timing analysis must be done to verify proper AC timings.

To maintain signal integrity, serial termination resistors should be inserted into all EMIF output signal lines (see the Terminal Functions table for the EMIF output signals).

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

Table 45. C6713B Example Boards and Maximum EMIF Speed

| BOARD CONFIGURATION | | | SDRAM SPEED GRADE | MAXIMUM ACHIEVABLE EMIF-SDRAM INTERFACE SPEED |
|----------------------|--|---|----------------------------|--|
| TYPE | EMIF INTERFACE COMPONENTS | BOARD TRACE | | |
| 1-Load Short Traces | One bank of one 32-Bit SDRAM | 1 to 3-inch traces with proper termination resistors; Trace impedance ~ 50 Ω | 143 MHz 32-bit SDRAM (-7) | 100 MHz |
| | | | 166 MHz 32-bit SDRAM (-6) | For short traces, SDRAM data output hold time on these SDRAM speed grades cannot meet EMIF input hold time requirement (see NOTE 1). |
| | | | 183 MHz 32-bit SDRAM (-55) | |
| | | | 200 MHz 32-bit SDRAM (-5) | |
| 2-Loads Short Traces | One bank of two 16-Bit SDRAMs | 1.2 to 3 inches from EMIF to each load, with proper termination resistors; Trace impedance ~ 78 Ω | 125 MHz 16-bit SDRAM (-8E) | 100 MHz |
| | | | 133 MHz 16-bit SDRAM (-75) | 100 MHz |
| | | | 143 MHz 16-bit SDRAM (-7E) | 100 MHz |
| | | | 167 MHz 16-bit SDRAM (-6A) | 100 MHz |
| 3-Loads Short Traces | One bank of two 16-Bit SDRAMs One bank of buffer | 1.2 to 3 inches from EMIF to each load, with proper termination resistors; Trace impedance ~ 78 Ω | 125 MHz 16-bit SDRAM (-8E) | For short traces, EMIF cannot meet SDRAM input hold requirement (see NOTE 1). |
| | | | 133 MHz 16-bit SDRAM (-75) | 100 MHz |
| | | | 143 MHz 16-bit SDRAM (-7E) | 100 MHz |
| | | | 167 MHz 16-bit SDRAM (-6A) | 100 MHz |
| 3-Loads Long Traces | One bank of one 32-Bit SDRAM One bank of one 32-Bit SDRAM One bank of buffer | 4 to 7 inches from EMIF; Trace impedance ~ 63 Ω | 143 MHz 32-bit SDRAM (-7) | 83 MHz |
| | | | 166 MHz 32-bit SDRAM (-6) | 83 MHz |
| | | | 183 MHz 32-bit SDRAM (-55) | 83 MHz |
| | | | 200 MHz 32-bit SDRAM (-5) | SDRAM data output hold time cannot meet EMIF input hold requirement (see NOTE 1). |

NOTE 1: Results are based on IBIS simulations for the given example boards (TYPE). Timing analysis should be performed to determine if timing requirements can be met for the particular system.

EMIF big endian mode correctness

The HD8 pin device endian mode (LENDIAN) selects the endian mode of operation (Little or Big Endian). For the C6713B device Little Endian is the default setting.

The HD12 pin (EMIF Big Endian Mode Correctness) [$\overline{\text{EMIFBE}}$] enhancement allows the flexibility to change the EMIF data placement on the EMIF bus.

When using the default setting of HD12 = 1 for the C6713B, the EMIF will present 8-bit or 16-bit data on the ED[7:0] side of the bus if using Little Endian mode (HD8 = 1) and to the ED[31:24] side of the bus if using Big Endian mode. Figure 23 shows the mapping of 16-bit and 8-bit C6713B devices.

| EMIF DATA LINES (PINS) WHERE DATA PRESENT | | | |
|---|---------------------------------------|---|--|
| ED[31:24] ($\overline{\text{BE3}}$) | ED[23:16] ($\overline{\text{BE2}}$) | ED[15:8] ($\overline{\text{BE1}}$) | ED[7:0] ($\overline{\text{BE0}}$) |
| 32-Bit Device in Any Endianness Mode | | | |
| 16-Bit Device in Big Endianness Mode | | 16-Bit Device in Little Endianness Mode | |
| 8-Bit Device in Big Endianness Mode | | | 8-Bit Device in Little Endianness Mode |

Figure 23. 16/8-Bit EMIF Big Endian Mode Correctness Mapping (HD12 = 1)

When HD12 = 0, enabling EMIF endianness correction, the EMIF will present 8-bit or 16-bit data on the ED[7:0] side of the bus, regardless of the endianness mode (see Figure 24).

| EMIF DATA LINES (PINS) WHERE DATA PRESENT | | | |
|---|---------------------------------------|---|--|
| ED[31:24] ($\overline{\text{BE3}}$) | ED[23:16] ($\overline{\text{BE2}}$) | ED[15:8] ($\overline{\text{BE1}}$) | ED[7:0] ($\overline{\text{BE0}}$) |
| 32-Bit Device in Any Endianness Mode | | | |
| | | 16-Bit Device in Any Endianness Mode | |
| | | | 8-Bit Device in Any Endianness Mode |

Figure 24. 16/8-Bit EMIF Big Endian Mode Correctness Mapping (HD12 = 0)

This *new* endianness correction functionality does not affect systems using the default value of HD12 = 1.

This *new* feature does *not* affect systems operating in Little Endian mode.

TMS320C6713B

FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

bootmode

The device resets using the active-low signal $\overline{\text{RESET}}$ and the internal reset signal. While $\overline{\text{RESET}}$ is low, the internal reset is also asserted and the device is held in reset and is initialized to the prescribed reset state. Refer to reset timing for reset timing characteristics and states of device pins during reset. The release of the internal reset signal (see the Reset Phase 3 discussion in the Reset Timing section of this data sheet) starts the processor running with the prescribed device configuration and boot mode.

The C6713B has three types of boot modes:

- Host boot

If host boot is selected, upon release of internal reset, the CPU is internally “stalled” while the remainder of the device is released. During this period, an external host can initialize the CPU’s memory space as necessary through the host interface, including internal configuration registers, such as those that control the EMIF or other peripherals. Once the host is finished with all necessary initialization, it must set the DSPINT bit in the HPIC register to complete the boot process. This transition causes the boot configuration logic to bring the CPU out of the “stalled” state. The CPU then begins execution from address 0. The DSPINT condition is not latched by the CPU, because it occurs while the CPU is still internally “stalled”. Also, DSPINT brings the CPU out of the “stalled” state only if the host boot process is selected. All memory may be written to and read by the host. This allows for the host to verify what it sends to the DSP if required. After the CPU is out of the “stalled” state, the CPU needs to clear the DSPINT, otherwise, no more DSPINTs can be received.

- Emulation boot

Emulation boot mode is a variation of host boot. In this mode, it is not necessary for a host to load code or to set DSPINT to release the CPU from the “stalled” state. Instead, the emulator will set DSPINT if it has not been previously set so that the CPU can begin executing code from address 0. Prior to beginning execution, the emulator sets a breakpoint at address 0. This prevents the execution of invalid code by halting the CPU prior to executing the first instruction. Emulation boot is a good tool in the debug phase of development.

- EMIF boot (using default ROM timings)

Upon the release of internal reset, the 1K-Byte ROM code located in the beginning of $\overline{\text{CE1}}$ is copied to address 0 by the EDMA using the default ROM timings, while the CPU is internally “stalled”. The data should be stored in the endian format that the system is using. The boot process also lets you choose the width of the ROM. In this case, the EMIF automatically assembles consecutive 8-bit bytes or 16-bit half-words to form the 32-bit instruction words to be copied. The transfer is automatically done by the EDMA as a single-frame block transfer from the ROM to address 0. After completion of the block transfer, the CPU is released from the “stalled” state and start running from address 0.

reset

A hardware reset ($\overline{\text{RESET}}$) is required to place the DSP into a known good state out of power-up. The $\overline{\text{RESET}}$ signal can be asserted (pulled low) prior to ramping the core and I/O voltages or after the core and I/O voltages have reached their proper operating conditions. As a best practice, reset should be held low during power-up. Prior to deasserting $\overline{\text{RESET}}$ (low-to-high transition), the core and I/O voltages should be at their proper operating conditions and CLKIN should also be running at the correct frequency.

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

absolute maximum ratings over operating case temperature range (unless otherwise noted)[†]

| | |
|--|-----------------------------|
| Supply voltage range, CV_{DD} (see Note 2) | –0.3 V to 1.8 V |
| Supply voltage range, DV_{DD} (see Note 2) | –0.3 V to 4 V |
| Input voltage range | –0.3 V to $DV_{DD} + 0.5$ V |
| Output voltage range | –0.3 V to $DV_{DD} + 0.5$ V |
| Operating case temperature ranges, T_C : (default) | 0°C to 90°C |
| (A version) [GDPA/ZDPA-200, PYPA-167,-200] | –40°C to 105°C |
| Storage temperature range, T_{stg} | –65°C to 150°C |

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 2: All voltage values are with respect to V_{SS} .

recommended operating conditions[†]

| | | MIN | NOM | MAX | UNIT | | |
|-----------|---|--|-----|-------------------|---------------------|------|---|
| CV_{DD} | Supply voltage, Core referenced to V_{SS} | PYP packages only | | 1.14 | 1.20 | 1.32 | V |
| | | GDP/ZDP packages for C6713B only | | 1.14 [‡] | 1.20 [‡] | 1.32 | V |
| | | GDP/ZDP packages for C6713B–300 only | | 1.33 | 1.4 | 1.47 | V |
| DV_{DD} | Supply voltage, I/O referenced to V_{SS} | 3.13 | 3.3 | 3.47 | V | | |
| V_{IH} | High-level input voltage (See Figure 28) | All signals except $CLKS1/SCL1$, $DR1/SDA1$, $SCL0$, $SDA0$, and $RESET$ | | 2 | | V | |
| | | $CLKS1/SCL1$, $DR1/SDA1$, $SCL0$, $SDA0$, and $RESET$ | | 2 | | V | |
| V_{IL} | Low-level input voltage (See Figure 29) | All signals except $CLKS1/SCL1$, $DR1/SDA1$, $SCL0$, $SDA0$, and $RESET$ | | | 0.8 | V | |
| | | $CLKS1/SCL1$, $DR1/SDA1$, $SCL0$, $SDA0$, and $RESET$ | | | $0.3 \cdot DV_{DD}$ | V | |
| I_{OH} | High-level output current [§] | All signals except $ECLKOUT$, $CLKOUT2$, $CLKS1/SCL1$, $DR1/SDA1$, $SCL0$, and $SDA0$ | | | –8 | mA | |
| | | $ECLKOUT$ and $CLKOUT2$ | | | –16 | mA | |
| I_{OL} | Low-level output current [§] | All signals except $ECLKOUT$, $CLKOUT2$, $CLKS1/SCL1$, $DR1/SDA1$, $SCL0$, and $SDA0$ | | | 8 | mA | |
| | | $ECLKOUT$ and $CLKOUT2$ | | | 16 | mA | |
| | | $CLKS1/SCL1$, $DR1/SDA1$, $SCL0$, and $SDA0$ | | | 3 | mA | |
| V_{OS} | Maximum voltage during overshoot (See Figure 28) | | | 4 [¶] | V | | |
| V_{US} | Maximum voltage during undershoot (See Figure 29) | | | –0.7 [¶] | V | | |
| T_C | Operating case temperature | Default | | 0 | 90 | °C | |
| | | A version (GDPA/ZDPA -200, PYPA-167,-200) | | –40 | 105 | | |

[†] The core supply should be powered up prior to (and powered down after), the I/O supply. Systems should be designed to ensure that neither supply is powered up for an extended period of time if the other supply is below the proper operating voltage.

[‡] These values are compatible with existing 1.26-V designs.

[§] Refers to DC (or steady state) currents only, actual switching currents are higher. For more details, see the device-specific IBIS models.

[¶] The absolute maximum ratings should *not* be exceeded for more than 30% of the cycle period.

† For test conditions shown as MIN, MAX, or NOM, use the appropriate value specified in the recommended operating conditions table.

‡ Measured with average activity (50% high/50% low power) at 25°C case temperature and 100-MHz EMIF. This model represents a device performing high-DSP-activity operations 50% of the time, and the remainder performing low-DSP-activity operations. The high/low-DSP-activity models are defined as follows:

High-DSP-Activity Model:

- CPU: 8 instructions/cycle with 2 LDDW instructions [L1 Data Memory: 128 bits/cycle via LDDW instructions;
- L1 Program Memory: 256 bits/cycle; L2/EMIF EDMA: 50% writes, 50% reads to/from SDRAM (50% bit-switching)]
- McBSP: 2 channels at E1 rate
- Timers: 2 timers at maximum rate

Low-DSP-Activity Model:

- CPU: 2 instructions/cycle with 1 LDH instruction [L1 Data Memory: 16 bits/cycle; L1 Program Memory: 256 bits per 4 cycles;
- L2/EMIF EDMA: None]
- McBSP: 2 channels at E1 rate
- Timers: 2 timers at maximum rate

The actual current draw is highly application-dependent. For more details on core and I/O activity, refer to the TMS320C6711D, C6712D, C6713B Power Consumption Summary application report (literature number SPRA889A2 or later).

PARAMETER MEASUREMENT INFORMATION

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

Figure 25. Test Load Circuit for AC Timing Measurements

signal transition levels

All input and output timing parameters are referenced to 1.5 V for both “0” and “1” logic levels.

Figure 26. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to $V_{IL\ MAX}$ and $V_{IH\ MIN}$ for input clocks, $V_{OL\ MAX}$ and $V_{OH\ MIN}$ for output clocks.

AC transient rise/fall time specifications

Figure 28 and Figure 29 show the AC transient specifications for Rise and Fall Time. For device-specific information on these values, refer to the Recommended Operating Conditions section of this Data Sheet.

Figure 28. AC Transient Specification Rise Time

† t_c = the peripheral cycle time.

Figure 29. AC Transient Specification Fall Time

† t_c = the peripheral cycle time.

PARAMETER MEASUREMENT INFORMATION (CONTINUED)

timing parameters and board routing analysis

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

For inputs, timing is most impacted by the round-trip propagation delay from the DSP to the external device and from the external device to the DSP. This round-trip delay tends to negatively impact the input setup time margin, but also tends to improve the input hold time margins (see Table 46 and Figure 30).

Figure 30 represents a general transfer between the DSP and an external device. The figure also represents board route delays and how they are perceived by the DSP and the external device.

PARAMETER MEASUREMENT INFORMATION (CONTINUED)

Table 46. Board-Level Timings Example (see Figure 30)

| NO. | DESCRIPTION |
|-----|--|
| 1 | Clock route delay |
| 2 | Minimum DSP hold time |
| 3 | Minimum DSP setup time |
| 4 | External device hold time requirement |
| 5 | External device setup time requirement |

† The reference points for the rise and fall transitions are measured at $V_{OL\ MAX}$ and $V_{OH\ MIN}$.

§ $C3 = \text{CLKOUT3 period in ns. CLKOUT3 period is a divide-down of the CPU clock, configurable via the OSCDIV1 register. For more details, see PLL and PLL controller.}$

NOTE A: For this example, the CLKOUT3 frequency is CLKIN divide-by-2.

Figure 33. CLKOUT3 Timings

INPUT AND OUTPUT CLOCKS (CONTINUED)

timing requirements for ECLKIN† (see Figure 34)

| NO. | | PYP-200,-225 GDP/ZDP -225, -300 PYPA -167, -200 GDPA/ZDPA -200 | | UNIT |
|-----|--|---|-----|------|
| | | MIN | MAX | |
| 1 | $t_c(\text{EKI})$ Cycle time, ECLKIN | 10 | | ns |
| 2 | $t_w(\text{EKIH})$ Pulse duration, ECLKIN high | 4.5 | | ns |
| 3 | $t_w(\text{EKIL})$ Pulse duration, ECLKIN low | 4.5 | | ns |
| 4 | $t_t(\text{EKI})$ Transition time, ECLKIN | | 3 | ns |

† The reference points for the rise and fall transitions are measured at $V_{IL \text{ MAX}}$ and $V_{IH \text{ MIN}}$.

Figure 34. ECLKIN Timings

switching characteristics over recommended operating conditions for ECLKOUT‡§# (see Figure 35)

| NO. | PARAMETER | PYP-200, -225 GDP/ZDP -225, -300 PYPA -167, -200 GDPA/ZDPA -200 | | UNIT |
|-----|---|--|----------|------|
| | | MIN | MAX | |
| 1 | $t_c(\text{EKO})$ Cycle time, ECLKOUT | E - 0.9 | E + 0.9 | ns |
| 2 | $t_w(\text{EKOH})$ Pulse duration, ECLKOUT high | EH - 0.9 | EH + 0.9 | ns |
| 3 | $t_w(\text{EKOL})$ Pulse duration, ECLKOUT low | EL - 0.9 | EL + 0.9 | ns |
| 4 | $t_t(\text{EKO})$ Transition time, ECLKOUT | | 2 | ns |
| 5 | $t_d(\text{EKIH-EKOH})$ Delay time, ECLKIN high to ECLKOUT high | 1 | 6.5 | ns |
| 6 | $t_d(\text{EKIL-EKOL})$ Delay time, ECLKIN low to ECLKOUT low | 1 | 6.5 | ns |

‡ The reference points for the rise and fall transitions are measured at $V_{OL \text{ MAX}}$ and $V_{OH \text{ MIN}}$.

§ E = ECLKIN period in ns

EH is the high period of ECLKIN in ns and EL is the low period of ECLKIN in ns.

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

ASYNCHRONOUS MEMORY TIMING

timing requirements for asynchronous memory cycles^{†‡§} (see Figure 36–Figure 37)

| NO. | | PYP-200,-225 GDP/ZDP -225, -300 PYPA -167, -200 GDPA/ZDPA -200 | | UNIT |
|-----|---|---|-----|------|
| | | MIN | MAX | |
| 3 | $t_{su}(EDV-AREH)$ Setup time, EDx valid before \overline{ARE} high | 6.5 | | ns |
| 4 | $t_h(AREH-EDV)$ Hold time, EDx valid after \overline{ARE} high | 1 | | ns |
| 6 | $t_{su}(ARDY-EKOH)$ Setup time, ARDY valid before ECLKOUT high | 3 | | ns |
| 7 | $t_h(EKOH-ARDY)$ Hold time, ARDY valid after ECLKOUT high | 2.3 | | ns |

[†] To ensure data setup time, simply program the strobe width wide enough. ARDY is internally synchronized. The ARDY signal is recognized in the cycle for which the setup and hold time is met. To use ARDY as an asynchronous input, the pulse width of the ARDY signal should be wide enough (e.g., pulse width = 2E) to ensure setup and hold time is met.

[‡] RS = Read setup, RST = Read strobe, RH = Read hold, WS = Write setup, WST = Write strobe, WH = Write hold. These parameters are programmed via the EMIF CE space control registers.

[§] E = ECLKOUT period in ns

switching characteristics over recommended operating conditions for asynchronous memory cycles^{†§¶} (see Figure 36–Figure 37)

| NO. | PARAMETER | PYP-200,-225 GDP/ZDP -225, -300 PYPA -167, -200 GDPA/ZDPA -200 | | UNIT |
|-----|--|---|-----|------|
| | | MIN | MAX | |

RESET TIMING

timing requirements for reset^{†‡} (see Figure 49)

| NO. | | | PYP-200,-225 GDP/ZDP -225, -300 PYPA -167, -200 GDPA/ZDPA -200 | | UNIT |
|-----|---------------------|---|---|-----|------|
| | | | MIN | MAX | |
| 1 | $t_w(\text{RST})$ | Pulse duration, $\overline{\text{RESET}}$ | 100 | | ns |
| 13 | $t_{su}(\text{HD})$ | Setup time, HD boot configuration bits valid before $\overline{\text{RESET}}$ high [§] | 2P | | ns |
| 14 | $t_h(\text{HD})$ | Hold time, HD boot configuration bits valid after $\overline{\text{RESET}}$ high [§] | 2P | | ns |

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.3 ns.

[‡] For the C6713B device, the PLL is bypassed immediately after the device comes out of reset. The PLL Controller can be programmed to change the PLL mode in software. For more detailed information on the PLL Controller, see the *TMS320C6000 DSP Phase-Lock Loop (PLL) Controller Peripheral Reference Guide* (literature number SPRU233).

[§] The Boot and device configurations bits are latched asynchronously when RESET is transitioning high. The Boot and device configurations bits consist of: HD[14, 8, 4:3].

switching characteristics over recommended operating conditions during reset[¶] (see Figure 49)

| NO. | PARAMETER | | PYP-200,-225 GDP/ZDP -225, -300 PYPA-167, -200 GDPA/ZDPA -200 | | UNIT |
|-----|----------------------------|---|--|--------------------|------|
| | | | MIN | MAX | |
| 2 | $t_d(\text{RSTH-ZV})$ | Delay time, external $\overline{\text{RESET}}$ high to internal reset high and all signal groups valid [#] | CLKMODE0 = 1 | 512 x CLKIN period | ns |
| 3 | $t_d(\text{RSTL-ECKOL})$ | Delay time, $\overline{\text{RESET}}$ low to ECLKOUT high impedance | | 0 | ns |
| 4 | $t_d(\text{RSTH-ECKOV})$ | Delay time, $\overline{\text{RESET}}$ high to ECLKOUT valid | | 6P | ns |
| 5 | $t_d(\text{RSTL-CKO2IV})$ | Delay time, $\overline{\text{RESET}}$ low to CLKOUT2 high impedance | | 0 | ns |
| 6 | $t_d(\text{RSTH-CKO2V})$ | Delay time, $\overline{\text{RESET}}$ high to CLKOUT2 valid | | 6P | ns |
| 7 | $t_d(\text{RSTL-CKO3L})$ | Delay time, $\overline{\text{RESET}}$ low to CLKOUT3 low | | 0 | ns |
| 8 | $t_d(\text{RSTH-CKO3V})$ | Delay time, $\overline{\text{RESET}}$ high to CLKOUT3 valid | | 6P | ns |
| 9 | $t_d(\text{RSTL-EMIFZH})$ | Delay time, $\overline{\text{RESET}}$ low to EMIF Z group high impedancell | | 0 | ns |
| 10 | $t_d(\text{RSTL-EMIFLIV})$ | Delay time, $\overline{\text{RESET}}$ low to EMIF low group (BUSREQ) invalidll | | 0 | ns |
| 11 | $t_d(\text{RSTL-Z1HZ})$ | Delay time, $\overline{\text{RESET}}$ low to Z group 1 high impedancell | | 0 | ns |
| 12 | $t_d(\text{RSTL-Z2HZ})$ | Delay time, $\overline{\text{RESET}}$ low to Z group 2 high impedancell | | 0 | ns |

[¶] P = 1/CPU clock frequency in ns.

Note that while internal reset is asserted low, the CPU clock (SYSCLK1) period is equal to the input clock (CLKIN) period multiplied by 8. For example, if the CLKIN period is 20 ns, then the CPU clock (SYSCLK1) period is 20 ns x 8 = 160 ns. Therefore, P = SYSCLK1 = 160 ns while internal reset is asserted.

[#] The internal reset is stretched exactly 512 x CLKIN cycles if CLKIN is used (CLKMODE0 = 1). If the input clock (CLKIN) is not stable when RESET is deasserted, the actual delay time may vary.

ll EMIF Z group consists of: EA[21:2], ED[31:0], CE[3:0], BE[3:0], ARE/SDCAS/SSADS, AWE/SDWE/SSWE, AOE/SDRAS/SSOE and HOLDA

EMIF low group consists of: BUSREQ

Z group 2 consists of: All other HPI, McASP0/1, GPIO, and I2C1 signals.

TMS320C6713B FLOATING-POINT DIGITAL SIGNAL PROCESSOR

SPRS294B – OCTOBER 2005 – REVISED JUNE 2006

RESET TIMING (CONTINUED)

† EMIF Z group consists of: EA[21:2], ED[31:0], CE[3:0], BE[3:0], ARE/SDCAS/SSADS, AWE/SDWE/SSWE, AOE/SDRAS/SSOE and HOLDA

EMIF low group consists of: BUSREQ

Z group 1 consists of: CLKR0/ACLKR0, CLKR1/AXR0[6], CLKX0/ACLKX0, CLKX1/AMUTE0, FSR0/AFSR0, FSR1/AXR0[7], FSX0/AFSX0, FSX1, DX0/AXR0[1], DX1/AXR0[5], TOUT0/AXR0[2], TOUT1/AXR0[4], SDA0 and SCL0.

Z group 2 consists of: All other HPI, McASP0/1, GPIO, and I2C1 signals.

‡ Boot and device configurations consist of: HD[14, 8, 4:3].

Figure 49. Reset Timing

Reset Phase 1: The $\overline{\text{RESET}}$ pin is asserted. During this time, all internal clocks are running at the CLKIN frequency divide-by-8. The CPU is also running at the CLKIN frequency divide-by-8.

Reset Phase 2: The $\overline{\text{RESET}}$ pin is deasserted but the internal reset is stretched. During this time, all internal clocks are running at the CLKIN frequency divide-by-8. The CPU is also running at the CLKIN frequency divide-by-8.

Reset Phase 3: Both the $\overline{\text{RESET}}$ pin and internal reset are deasserted. During this time, all internal clocks are running at their default divide-down frequency of CLKIN. The CPU clock (SYSCLK1) is running at CLKIN frequency. The peripheral clock (SYSCLK2) is running at CLKIN frequency divide-by-2. The EMIF internal clock source (SYSCLK3) is running at CLKIN frequency divide-by-2. SYSCLK3 is reflected on the ECLKOUT pin (when EKSRC bit = 0 [default]). CLKOUT3 is running at CLKIN frequency divide-by-8.

EXTERNAL INTERRUPT TIMING

timing requirements for external interrupts[†] (see Figure 50)

| 4 | $t_{w(SCLL)}$ | Pulse duration, SCL low | | 4.7 | 1.3 | μs |
| 5 | $t_{w(SCLH)}$ | Pulse duration, SCL high | | 4 | 0.6 | μs |
| 6 | $t_{su(SDAV-SDLH)}$ | Setup time, SDA valid before SCL high | | 250 | 100‡ | ns |
| 7 | $t_{h(SDA-SDLL)}$ | Hold time, SDA valid after SCL low (For I2C bus™ devices) | | 0§ | 0§ 0.9¶ | μs |
| 8 | $t_{w(SDAH)}$ | Pulse duration, SDA high between STOP and START conditions | | 4.7 | 1.3 | μs |
| 9 | $t_r(SDA)$ | Rise time, SDA | | 1000 | $20 + 0.1C_b^\#$ | 300 ns |
| 10 | $t_r(SCL)$ | Rise time, SCL | | 1000 | $20 + 0.1C_b^\#$ | 300 ns |
| 11 | $t_f(SDA)$ | Fall time, SDA | | 300 | $20 + 0.1C_b^\#$ | 300 ns |
| 12 | $t_f(SCL)$ | Fall time, SCL | | 300 | $20 + 0.1C_b^\#$ | 300 ns |
| 13 | $t_{su(SCLH-SDAH)}$ | Setup time, SCL high before SDA high (for STOP condition) | | 4 | 0.6 | μs |
| 14 | $t_w(SP)$ | Pulse duration, spike (must be suppressed) | | | 0 50 | ns |
| 15 | $C_b^\#$ | Capacitive load for each bus line | | 400 | 400 | pF |

† The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.

‡ A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement $t_{su(SDA-SCLH)} \geq 250$ ns must then be met.

This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_r \max + t_{su(SDA-SCLH)} = 1000 + 250 = 1250$ ns (according to the Standard-mode I2C-Bus Specification) before the SCL line is released.

§ A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.

¶ The maximum $t_h(SDA-SCLL)$ has only to be met if the device does not stretch the low period [$t_w(SCLL)$] of the SCL signal.

C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

| 17 | $t_d(\text{HSTBH-HRDYH})$ Delay time, $\overline{\text{HSTROBE}}$ high to $\overline{\text{HRDY}}$ high | 3 | 12 | ns |

[†] $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.

[‡] $P = 1/\text{CPU clock frequency}$ in ns. For example, when running parts at 300 MHz, use $P = 3.3$ ns.

[¶] $\overline{\text{HCS}}$ enables $\overline{\text{HRDY}}$, and $\overline{\text{HRDY}}$ is always low when $\overline{\text{HCS}}$ is high. The case where $\overline{\text{HRDY}}$ goes high when $\overline{\text{HCS}}$ falls indicates that HPI is busy completing a previous HPID write or READ with autoincrement.

[#] This parameter is used during an HPID read. At the beginning of the first half-word transfer on the falling edge of $\overline{\text{HSTROBE}}$, the HPI sends the request to the EDMA internal address generation hardware, and $\overline{\text{HRDY}}$ remains high until the EDMA internal address generation hardware loads the requested data into HPID.

^{||} This parameter is used after the second half-word of an HPID write or autoincrement read. $\overline{\text{HRDY}}$ remains low if the access is not an HPID write or autoincrement read. Reading or writing to HPIC or HPIA does not affect the $\overline{\text{HRDY}}$ signal.

† CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

‡ P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.3 ns.

§ The minimum CLKR/X period is twice the CPU cycle time (2P) and not faster than 75 Mbps (13.3 ns). This means that the maximum bit rate for communications between the McBSP and other devices is 75 Mbps for 167-MHz and 225-MHz CPU clocks or 50 Mbps for 100-MHz CPU clock; where the McBSP is either the master or the slave. Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 67 Mbps; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 15 ns (67 MHz), whichever value is larger. For example, when running parts at 150 MHz (P = 6.7 ns), use 15 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 60 MHz (P = 16.67 ns), use 2P = 33 ns (30 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

¶ This parameter applies to the maximum McBSP frequency. Operate serial clocks (CLKR/X) in the reasonable range of 40/60 duty cycle.

MULTICHANNEL BUFFERED SERIAL PORT TIMING (CONTINUED)

switching characteristics over recommended operating conditions for McBSP^{†‡} (see Figure 59)

| 14 | $t_d(\text{FXH-DXV})$ | Delay time, FSX high to DX valid ONLY applies when in data delay 0 (XDATDLY = 00b) mode | FSX int | -1 | 7.5 | ns |
| | | | FSX ext | 2 | 11.5 | |

[†] CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

[‡] Minimum delay times also represent minimum output hold times.

[§] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.3 ns.

[¶] The minimum CLKR/X period is twice the CPU cycle time (2P) and not faster than 75 Mbps (13.3 ns). This means that the maximum bit rate for communications between the McBSP and other devices is 75 Mbps for 167-MHz and 225-MHz CPU clocks or 50 Mbps for 100-MHz CPU clock; where the McBSP is either the master or the slave. Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 67 Mbps; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 15 ns (67 MHz), whichever value is larger. For example, when running parts at 150 MHz (P = 6.7 ns), use 15 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 60 MHz (P = 16.67 ns), use 2P = 33 ns (30 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

[#] C = H or L

S = sample rate generator input clock = 2P if CLKSM = 1 (P = 1/CPU clock frequency)

= sample rate generator input clock = P_clks if CLKSM = 0 (P_clks = CLKS period)

H = CLKX high pulse width = (CLKGDV/2 + 1) * S if CLKGDV is even
= (CLKGDV + 1)/2 * S if CLKGDV is odd or zero

L = CLKX low pulse width = (CLKGDV/2) * S if CLKGDV is even
= (CLKGDV + 1)/2 * S if CLKGDV is odd or zero

CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the maximum limit (see [¶] footnote above).

^{||} Extra delay from CLKX high to DX valid applies *only* to the first data bit of a device, if and only if DXENA = 1 in SPCR.

If DXENA = 0, then D1 = D2 = 0

If DXENA = 1, then D1 = 2P, D2 = 4P

Figure 65. Timer Timing

GENERAL-PURPOSE INPUT/OUTPUT (GPIO) PORT TIMING

timing requirements for GPIO inputs^{†‡} (see Figure 66)

| NO. | | | PYP-200,-225 GDP/ZDP -225, -300 PYPA -167, -200 GDPA/ZDPA -200 | | UNIT |
|-----|---------------------|---------------------------|---|-----|------|
| | | | MIN | MAX | |
| 1 | $t_w(\text{GPIH})$ | Pulse duration, GPIx high | 4P | | ns |
| 2 | $t_w(\text{GPI L})$ | Pulse duration, GPIx low | 4P | | ns |

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.3 ns.

[‡] The pulse width given is sufficient to generate a CPU interrupt or an EDMA event. However, if a user wants to have the DSP recognize the GPIx changes through software polling of the GPIO register, the GPIx duration must be extended to at least 24P to allow the DSP enough time to access the GPIO register through the CFGBUS.

switching characteristics over recommended operating conditions for GPIO outputs^{†§} (see Figure 66)

| NO. | PARAMETER | PYP-200,-225 GDP/ZDP -225, -300 PYPA -167, -200 GDPA/ZDPA -200 | | UNIT | |
|-----|--------------------|---|---------|------|----|
| | | MIN | MAX | | |
| 3 | $t_w(\text{GPOH})$ | Pulse duration, GPOx high | 12P – 3 | | ns |
| 4 | $t_w(\text{GPOL})$ | Pulse duration, GPOx low | 12P – 3 | | ns |

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.3 ns.

[§] The number of CFGBUS cycles between two back-to-back CFGBUS writes to the GPIO register is 12 SYSCLK1 cycles; therefore, the minimum GPOx pulse width is 12P.

packaging information

For proper device thermal performance, the thermal pad **must** be soldered to an external ground thermal plane. This pad is electrically and thermally connected to the backside of the die. For the TMS320C6713B 208-Pin PowerPAD plastic quad flatpack, the external thermal pad dimensions are: 7.2 x 7.2 mm and the thermal pad is externally flush with the mold compound.

The following packaging information and addendum reflect the most current released data available for the designated device(s). This data is subject to change without notice and without revision of this document.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

THERMAL PAD MECHANICAL DATA

PYP (S-PQFP-G208)

PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

4206978-2/C 12/13

NOTE: A. All linear dimensions are in millimeters

Tie strap features may not be present.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
