

BATT Boost 2 Click

PID: MIKROE-6098

BATT Boost 2 Click is a compact add-on board designed to extend the battery life of non-rechargeable, primary batteries in low-voltage, low-power applications. This board features the NBM7100A, a coin-cell battery-life booster with adaptive power optimization from Nexperia. The NBM7100A integrates two high-efficiency DC-DC conversion stages and an intelligent learning algorithm to optimize energy usage, allowing it to handle bursts of current up to 200mA without depleting the battery. It features two output terminals: VDH for high pulse load applications and VDP for powering 'Always-ON' components. Communication with the host MCU is achieved via the I2C interface, supporting up to 1MHz clock frequencies. BATT Boost 2 Click is ideal for powering wireless IoT sensors, industrial devices, and wearable consumer electronics that require efficient power management and frequent bursts of energy.

How does it work?

BATT Boost 2 Click is based on the NBM7100A, a coin-cell battery-life booster with adaptive power optimization from Nexperia, designed to extend the battery life of non-rechargeable, primary batteries in low-voltage, low-power applications. This innovative solution is specifically designed to address the voltage drops and battery life limitations typically associated with high pulse current demands from primary batteries like the CR2032 coin cell attached to the back of the board. The NBM7100A's adaptive learning algorithm monitors the system's energy consumption and optimizes the internal DC-DC conversion process to manage the remaining charge in the storage capacitor efficiently, reducing energy waste. This makes BATT Boost 2 Click ideal for powering wireless IoT sensors, industrial devices, and wearable consumer electronics where efficient battery usage is crucial, especially in applications with high internal battery impedance and frequent bursts of power demand.

Mikroe produces entire development toolchains for all major microcontroller architectures.

Committed to excellency, we are dedicated to helping engineers bring the project development up to speed and achieve outstanding results.

ISO 27001: 2013 certification of informational security management system.
ISO 14001: 2015 certification of environmental management system.
OHSAS 18001: 2008 certification of occupational health and safety management system.

ISO 9001: 2015 certification of quality management system (QMS).

As mentioned, the NBM7100A integrates two high-efficiency DC-DC conversion stages and employs an intelligent learning algorithm to maximize the usable capacity of primary batteries. The first stage draws energy at a low, steady current from the battery and stores it in a capacitor. This stored energy is then released during the second stage of DC-DC conversion to supply a stable, regulated voltage with high pulse load capability on the VDH output terminal. This design allows the device to handle bursts of current, up to 200mA, without directly taxing the battery with large pulse currents, ensuring a longer, more predictable battery lifespan.

In addition to the VDH terminal, BATT Boost 2 Click features another output labeled VDP, which serves as a 'permanent' supply terminal with a maximum output current of 5mA. The VDP terminal is ideal for powering 'Always-ON' system components, such as the core and I/O of a host MCU. On the power supply side, the main power supply for the NBM7100A can be sourced either from the 3.3V mikroBUS™ socket or the attached coin battery on the back of the board, with the selection made via the VBAT SEL jumper.

The NBM7100A offers three distinct operating modes: Continuous, On-demand, and Auto mode. Continuous mode suits applications requiring immediate pulse load capability, ensuring the system can respond quickly to power demands. On-demand mode, on the other hand, is optimized for extending battery life in low-duty cycle applications, where the system remains in sleep mode for extended periods. Auto mode automates the process of managing power transitions between charging and active states without requiring constant oversight from the serial bus, using a HIGH logic level from the ON pin on the mikroBUS™ socket for control.

BATT Boost 2 Click uses a standard 2-wire I2C communication protocol, allowing the host MCU to control the NBM7100A, modify default configuration settings, and retrieve system information. The I2C interface supports clock frequencies up to 1MHz, with the device address selectable via the ADDR SEL jumper, which can be set to either position 0 or 1, corresponding to I2C addresses 0x2E or 0x2F. Additionally, several pins from the mikroBUS™ socket are used for further control of the NBM7100A: the ON pin manages the above-mentioned Auto mode, while the RDY pin provides a HIGH logic signal indicating that the NBM7100A is ready to deliver full power to the connected load.

This Click board™ can be operated only with a 3.3V logic voltage level. The board must perform appropriate logic voltage level conversion before using MCUs with different logic levels. Also, it comes equipped with a library containing functions and an example code that can be used as a reference for further development.

Mikroe produces entire development toolchains for all major microcontroller architectures.

Committed to excellency, we are dedicated to helping engineers bring the project development up to speed and achieve outstanding results.

ISO 27001: 2013 certification of informational security management system.
ISO 14001: 2015 certification of environmental management system.

ISO 9001: 2015 certification of quality management system (QMS).

Specifications

Type	Boost
Applications	Ideal for powering wireless IoT sensors, industrial devices, and wearable consumer electronics that require efficient power management and frequent bursts of energy
On-board modules	NBM7100A - coin-cell battery-life booster with adaptive power optimization from Nexperia
Key Features	Battery life booster with adaptive power optimization, high-pulse load capability, VDP terminal with a maximum output current of 5mA for low-power components, Continuous, On-demand, and Auto modes for optimized power management, I2C interface with selectable address, status indicator, and more
Interface	I2C
Feature	ClickID
Compatibility	mikroBUS™
Click board size	L (57.15 x 25.4 mm)
Input Voltage	3.3V

Pinout diagram

This table shows how the pinout on BATT Boost 2 Click corresponds to the pinout on the mikroBUS™ socket (the latter shown in the two middle columns).

Notes	Pin					Pin	Notes
	NC	1	AN	PWM	16	NC	
Auto Mode Control	ON	2	RST	INT	15	RDY	Status Indicator
ID COMM	CS	3	CS	RX	14	NC	
	NC	4	SCK	TX	13	NC	
	NC	5	MISO	SCL	12	SCL	I2C Clock
	NC	6	MOSI	SDA	11	SDA	I2C Data
Power Supply	3.3V	7	3.3V	5V	10	NC	
Ground	GND	8	GND	GND	9	GND	Ground

Onboard settings and indicators

Label	Name	Default	Description
LD1	PWR	-	Power LED Indicator
JP1	ADDR SEL	Left	I2C Address Selection 0/1: Left position 0, Right position 1
JP2	VBAT SEL	Left	NBM7100A Supply Voltage Source

Software Support

We provide a library for the BATT Boost 2 Click as well as a demo application (example), developed using MIKROE [compilers](#). The demo can run on all the main MIKROE [development boards](#).

Package can be downloaded/installed directly from NECTO Studio Package Manager (recommended), downloaded from our [LibStock™](#) or found on [MIKROE github account](#).

Library Description

This library contains API for BATT Boost 2 Click driver.

Key functions

- **battboost2_set_vset** This function is used to control the output voltage levels of the NBM7100ABQX, Coin cell battery life booster with adaptive power optimization on the BATT Boost 2 Click.
- **battboost2_high_impedance_mode** This function is used to configures the VDH high-impedance mode in Standby and Active states of the NBM7100ABQX, Coin cell battery life booster with adaptive power optimization on the BATT Boost 2 Click board.
- **battboost2_set_on_pin_state** This function sets the desired states of the ON (RST) pin of the NBM7100ABQX, Coin cell battery life booster with adaptive power optimization on the BATT Boost 2 Click board.

Example Description

This library contains API for the BATT Boost 2 Click driver. This driver provides the functions to control battery energy management device designed to maximize usable capacity from non-rechargeable.

The full application code, and ready to use projects can be installed directly from NECTO Studio Package Manager (recommended), downloaded from our [LibStock™](#) or found on [MIKROE github account](#).

Other MIKROE Libraries used in the example:

- MikroSDK.Board
- MikroSDK.Log

Additional notes and informations

Depending on the development board you are using, you may need [USB UART click](#), [USB UART 2 Click](#) or [RS232 Click](#) to connect to your PC, for development systems with no UART to USB interface available on the board. UART terminal is available in all MIKROE [compilers](#).

mikroSDK

This Click board™ is supported with [mikroSDK](#) - MIKROE Software Development Kit. To ensure proper operation of mikroSDK compliant Click board™ demo applications, mikroSDK should be downloaded from the [LibStock](#) and installed for the compiler you are using.

For more information about mikroSDK, visit the [official page](#).
