

DS26S10C/DS26S10M/DS26S11C/DS26S11M Quad Bus Transceivers

General Description

The DS26S10 and DS26S11 are quad Bus Transceivers consisting of 4 high speed bus drivers with open-collector outputs capable of sinking 100 mA at 0.8V and 4 high speed bus receivers. Each driver output is connected internally to the high speed bus receiver in addition to being connected to the package pin. The receiver has a Schottky TTL output capable of driving 10 Schottky TTL unit loads.

An active low enable gate controls the 4 drivers so that outputs of different device drivers can be connected together for party-line operation.

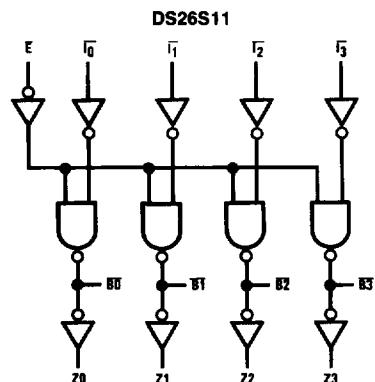

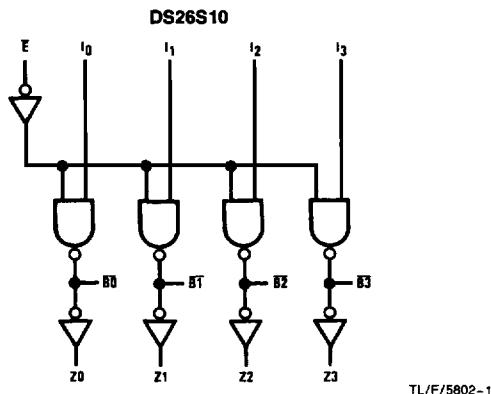

The bus output high-drive capability in the low state allows party-line operation with a line impedance as low as 100Ω. The line can be terminated at both ends, and still give considerable noise margin at the receiver. The receiver typical switching point is 2V.

The DS26S10 and DS26S11 feature advanced Schottky processing to minimize propagation delay. The device package also has 2 ground pins to improve ground current handling and allow close decoupling between V_{CC} and ground at the package. Both GND 1 and GND 2 should be tied to the ground bus external to the device package.

Features

- Input to bus is inverting on DS26S10

- Quad high speed open-collector bus transceivers
- Driver outputs can sink 100 mA at 0.8V maximum
- Advanced Schottky processing
- PNP inputs to reduce input loading
