

WD1038DH

High Efficiency 5V, 3A continuous, 1.5MHz Synchronous Step-Down Regulator

Descriptions

WD1038DH is a high efficiency 1.5MHz synchronous step-Down DC/DC regulator capable of delivering up to 3A output current. It can operate over a wide input voltage range from 2.7V to 5.5V and integrate main switch and synchronous switch with very low $R_{DS(on)}$ to minimize the conduction loss.

WD1038DH also provides over temperature protection (OTP), under-voltage lockout (UVLO), V_{out} short protection.

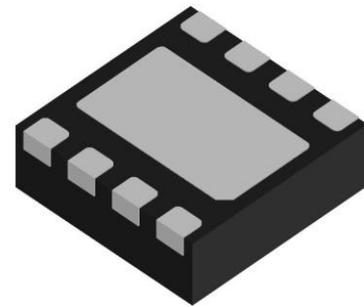

The WD1038DH is available in the DFN2x2-8L package. Standard product is Pb-Free and Halogen-Free.

Features

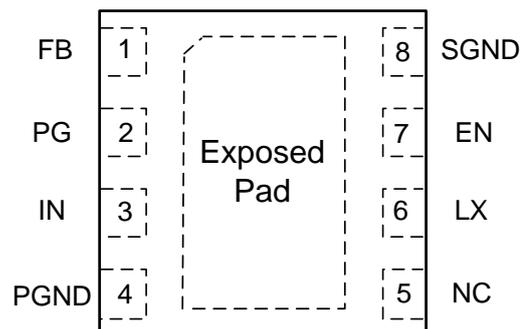

- Low R_{dson} internal Switches (top/bottom): 80/70m Ω
- 2.7-5.5V input voltage range
- 3A continuous load current capability
- 1.5MHz switching frequency minimizes the external components
- 35uA low quiescent current
- Internal soft-start limits the inrush current
- Peak Current Mode Control
- 100% Duty-Cycle Mode
- Power-Good Output

Applications

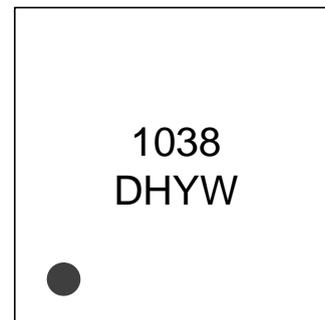

- Smart Phones
- TV
- Set Top Box and OTT box
- Access Point Router

Pin Descriptions

Pin Name	Pin Number	Pin Description
FB	1	Feedback pin. Connected to the feedback resistor for adjustable version or VOUT for fix output version.
PG	2	Power good indicator. The output of this pin is an open-drain with external pull-up resistor. PG is pulled up when the FB voltage is within 90%, otherwise it is LOW.
IN	3	Input pin. Decouple this pin to GND with at least 10uF ceramic Cap.
PGND	4	Power Ground.
NC	5	No Internal Connection.
LX	6	Inductor pin.
EN	7	Enable Control. Pull high to turn on. Do not leave it floating .
SGND	8	Signal Ground.
Exposed Pad		The exposed pad must be soldered to a large PCB and connected to PGND for maximum power dissipation.

Absolute Maximum Ratings ⁽¹⁾

Parameter	MIN	MAX	Unit
Power Supply VCC	-0.3	6.5	V
Others Pins	-0.3	VCC+0.6	V
Power Dissipation, P _D @ T _A =25°C, DFN2X2-8L		2.19	W
Package Thermal Resistance T _{JA}		50	°C/W
Package Thermal Resistance T _{JC}		8	°C/W
Junction Temperature T _J		150	°C
Lead Temperature (Soldering, 10 sec)		260	°C
Storage Temperature Range	-65	150	°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

Recommended Operating Conditions

Parameter	MIN	MAX	Unit
Power Supply VCC	2.7	5.5	V
Junction temperature T _J	-40	125	°C
Ambient temperature T _A	-40	85	°C

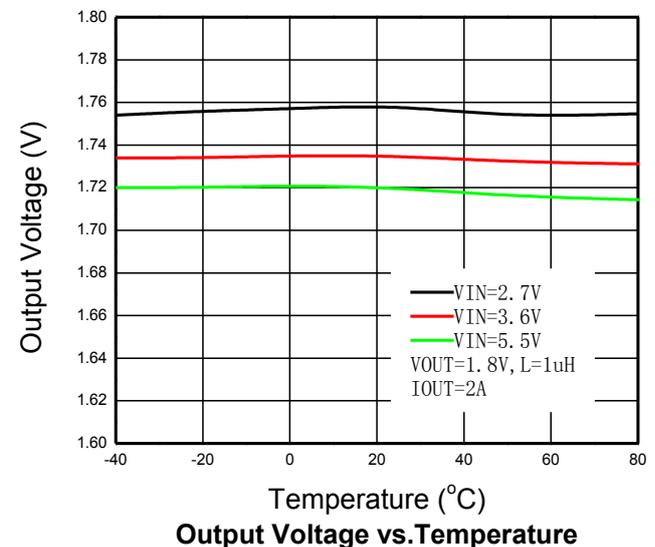

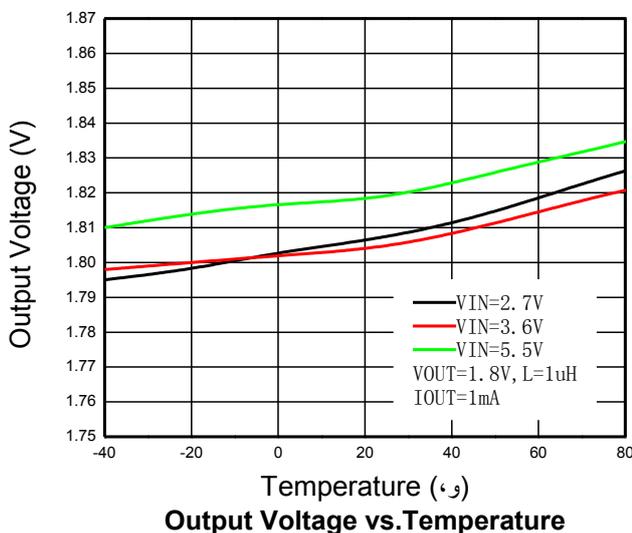

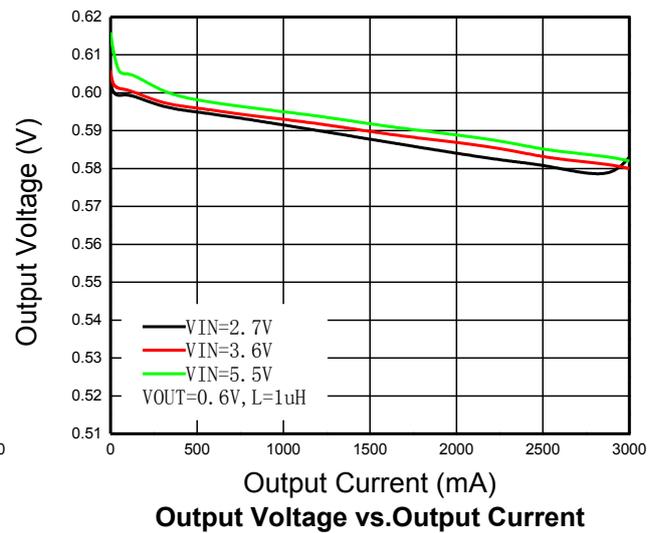

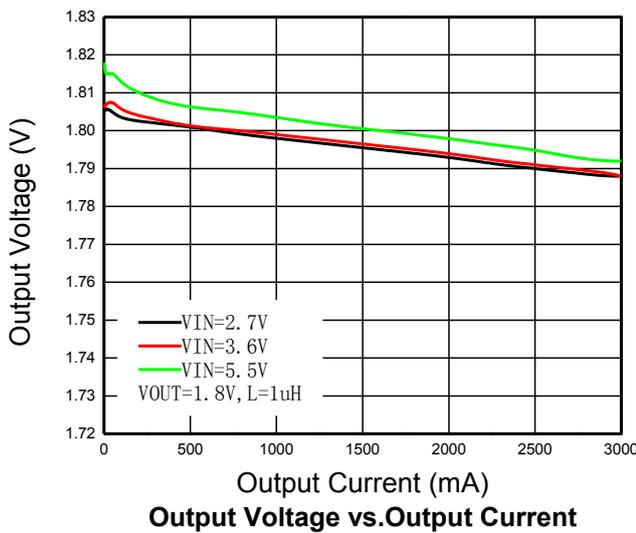

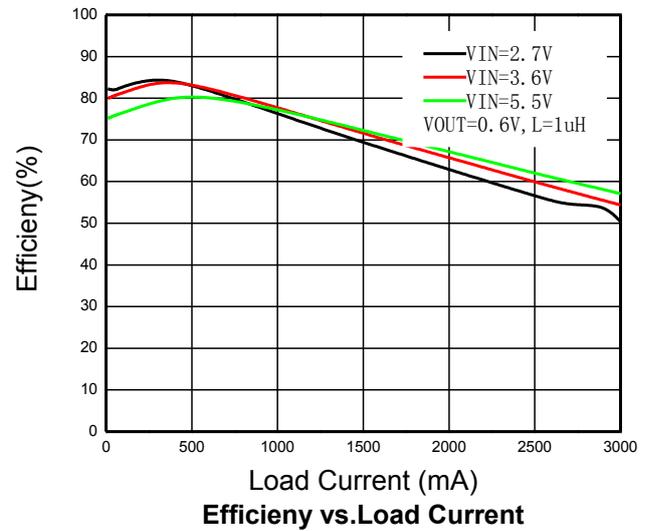

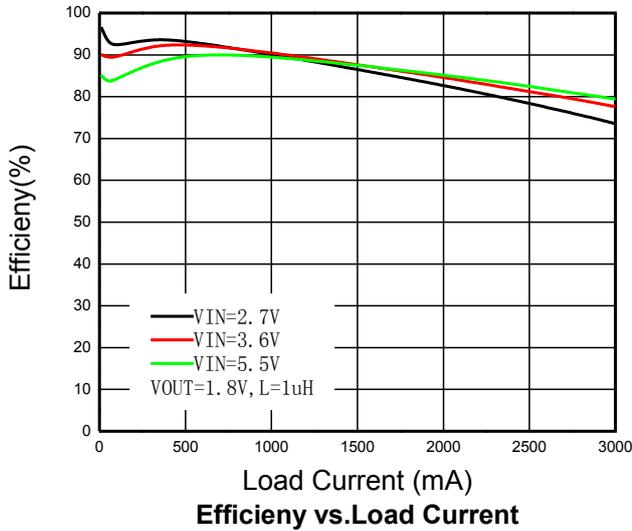

Electronics Characteristics

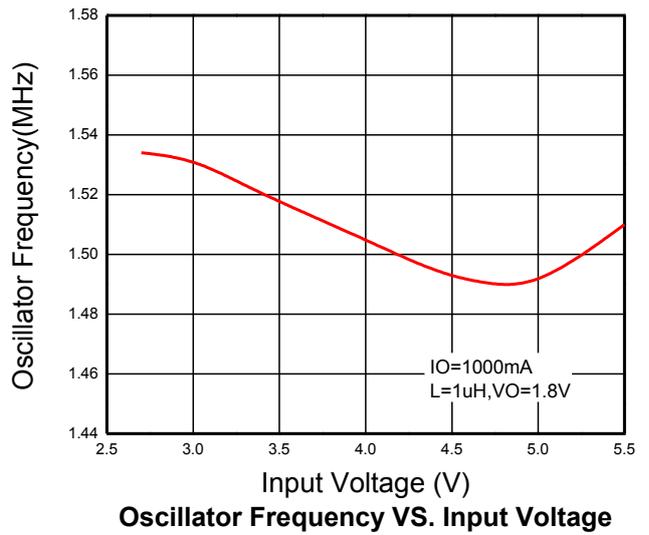

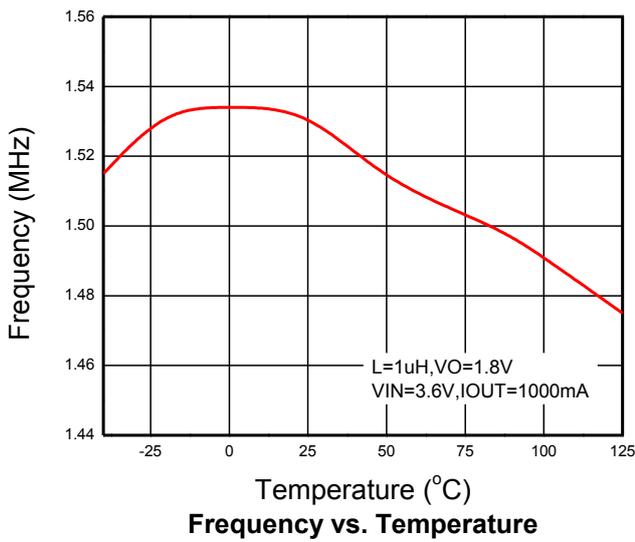

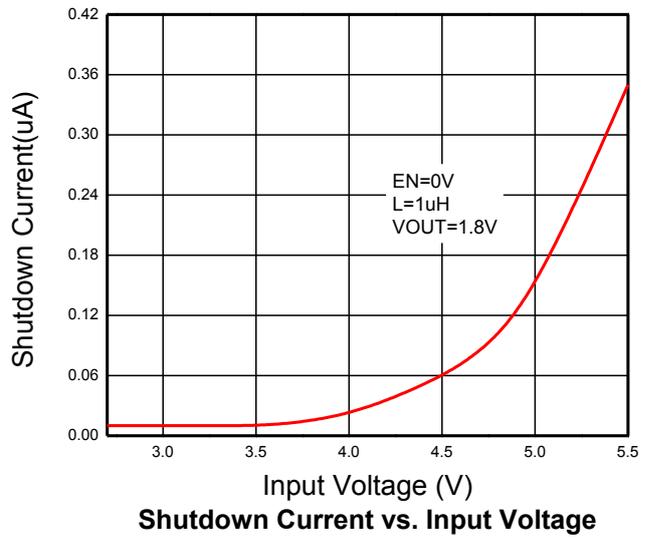

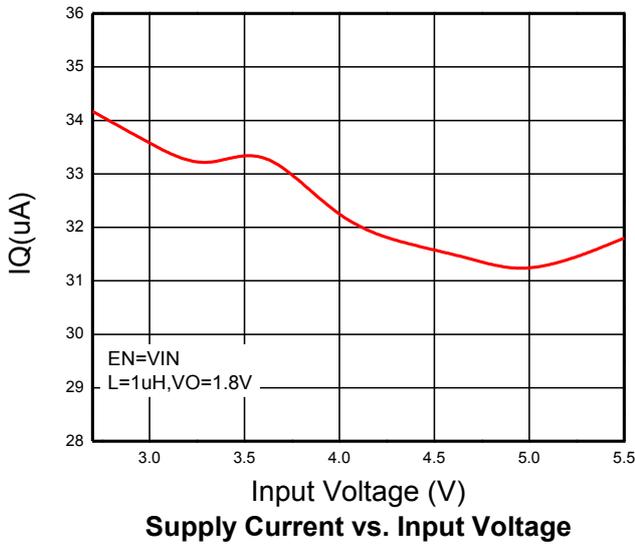

Unless otherwise specified: limits for typical values are for $T_A = 25^\circ\text{C}$ and minimum and maximum limits apply over the operating ambient temperature range ($-40^\circ\text{C} < T_A < 85^\circ\text{C}$); $V_{IN}=4.2\text{V}, V_{out}=2.5\text{V}, L1=1\mu\text{H}, C_{out}=22\mu\text{F}$.

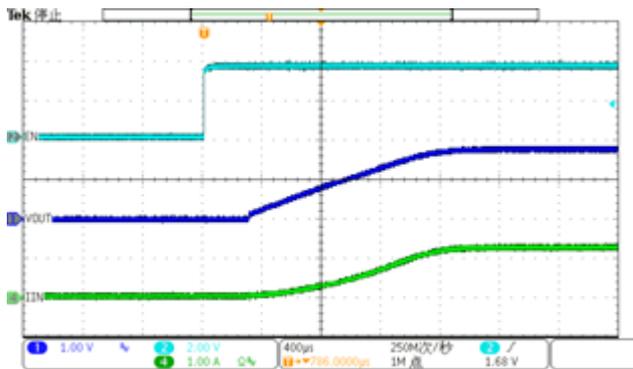

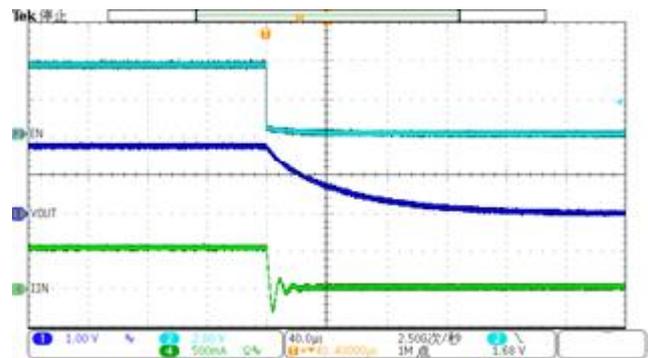

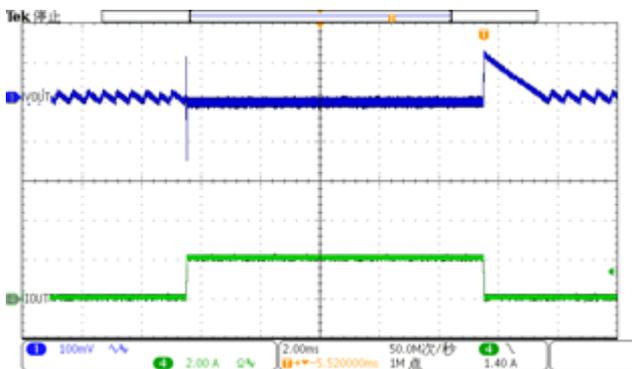

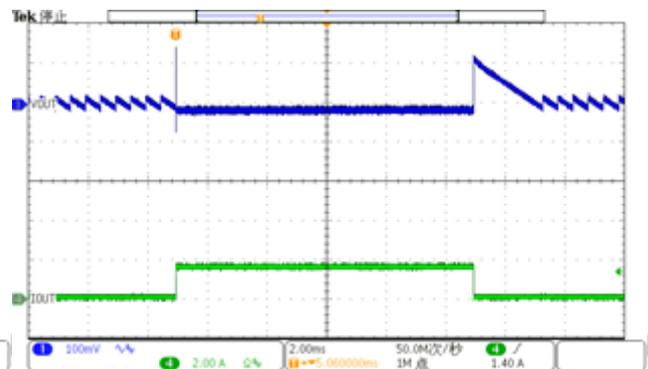

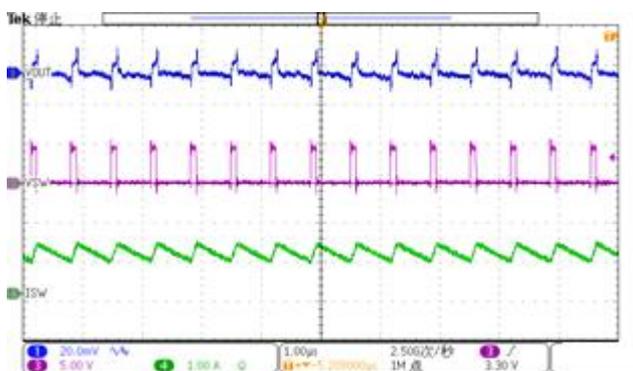

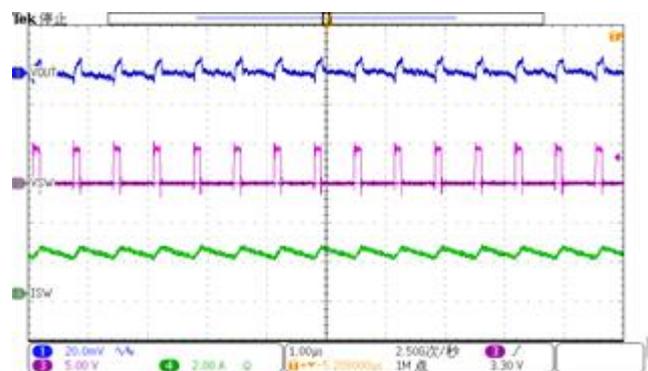

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Operation Voltage Range	V_{IN}		2.7		5.5	V
VIN Under Voltage	V_{UVLO-H}	V_{IN} Rising		2.45		V
Lockout	V_{UVLO-L}	V_{IN} Falling		2.35		V
Quiescent Current	I_Q	Switching		35		uA
		$V_{FB}=0.63\text{V}$, Non Switching		27		
Shutdown Current	I_{SD}	$V_{EN} = \text{GND}, V_{IN} = 3.6\text{V}$			1	μA
Feedback Reference	V_{REF}		0.588	0.6	0.612	V
Line Regulation	$\Delta V_{OUT} / \Delta V_{IN}$			0.35		%/V
PFET Rdson	$R_{dson P}$			80		m Ω
NFET Rdson	$R_{dson N}$			70		
PFET Current Limit	I_{LIMIT}			4.5		A
Oscillator Frequency	F_{OSC}			1.5		MHz
Max Duty Cycle				100		%
Soft Start Time				800		μS
Power on delay time				25		μS
Input OVP shutdown	V_{OVP}	Rising		6.4		V
		Falling	5.7	6.1		V
Over Volatage Protection Blanking Time				20		μS
Thermal Shutdown				150		$^\circ\text{C}$
Thermal Shutdown Hysteresis				25		$^\circ\text{C}$
EN Input LOW Voltage	V_{IL}				0.4	V
EN Input HIGH Voltage	V_{IH}		1.4			V

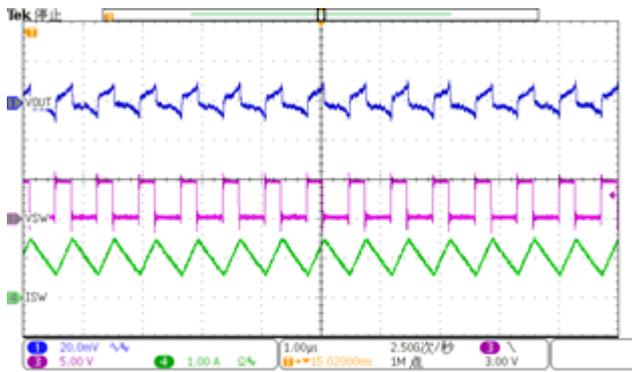

Typical Characteristics

($T_a=25^\circ\text{C}$, $V_{IN}=5\text{V}$, $V_{EN}=V_{IN}$, $C_{IN}=10\mu\text{F}$, $C_{OUT}=22\mu\text{F}$, $L=1\mu\text{H}$, unless otherwise noted)

Operation Information

WD1038DH is a high efficiency 1.5MHz synchronous Step-Down DC/DC regulator IC capable of delivering up to 3A output current. It can operate over a wide input voltage range from 2.7V to 5.5V and integrate main switch and synchronous switch with very low $R_{DS(on)}$ to minimize the conduction loss.

Application Information

Because of the high integration in the WD1038DH IC, the application circuit based on this regulator IC is rather simple. Only input capacitor C_{in} , output capacitor C_{out} , output inductor L and feedback resistors (R_H and R_L) need to be selected for the targeted applications specifications.

Feedback resistor dividers R_H and R_L :

Choose R_H and R_L to program the proper output voltage. To minimize the power consumption under light loads, it is desirable to choose larger resistance values for both R_H and R_L . A value of between 100k Ω and 1M Ω is highly recommended for both resistors. If $R_L = 120k\Omega$ is chosen, then R_H can be calculated to be:

$$R_H = \frac{(V_{out} - 0.6V) * R_L}{0.6V}$$

Input capacitor C_{IN} :

A Typical X7R or better grade ceramic capacitor with 10V rating and greater than 10uF capacitor is recommended. To minimize the potential noise problem, place this ceramic capacitor really close to the V_{IN} and GND pins. Care should be taken to minimize the loop area formed by C_{IN} , and V_{IN}/GND pins.

Output inductor L :

There are several considerations in choosing this inductor.

1) Choose the inductance to provide the desired

ripple current. It is suggested to choose the ripple current to be about 40% of the maximum output current. The inductance is calculated as:

$$L = \frac{V_{OUT}(1 - V_{out}/V_{IN,MAX})}{F_{SW} \times I_{OUT,MAX \times 40\%}}$$

Where F_{sw} is the switching frequency and $I_{out,max}$ is the maximum load current.

2) The saturation current rating of the inductor must be selected to be greater than the peak inductor current under full load conditions.

$$I_{SAT,MIN} > I_{OUT,MAX} + \frac{V_{OUT}(1 - V_{out}/V_{IN,MAX})}{2 * F_{SW} * L}$$

3) The DCR of the inductor and the core loss at the switching frequency must be low enough to achieve the desired efficiency requirement. It is desirable to choose an inductor with $DCR < 25m\Omega$ to achieve a good overall efficiency.

Inductor vs. Output Capacitor:

The ripple base control strategy need very little C_{OUT} to confirm stability. Too large inductor and C_{OUT} will lead to instability.

Power good:

The WD1038DH has a power good output. The PG pin goes high impedance once the output is above 90% and below 110% of the nominal voltage, and is driven low once the output voltage falls below typically 85% or above 115% of the nominal voltage. The PG pin is an open-drain output and is specified to sink up to 1 mA. The power good output requires a pull-up resistor connecting to any voltage rail less than 5.5 V. The PG signal can be used for sequencing of multiple rails by connecting it to the EN pin of other converters. Leave the PG pin unconnected when not used.

OCP and SCP protection :

With load current increasing, the PFET current will get higher till reach the current limit of PFET. The

PFET current limit will turn off the PFET till the next clock is coming. If the load current continues to increase, the output voltage will drop. When the output voltage falls below 30% of the regulation level, output short is detected and the IC will work in hiccup mode. During the hiccup, the regulator waits every 8 soft-start time before a soft-start. If at the time of soft-start finish, VOUT is still below 30% of the regulation level, the regulator will wait another 8 soft-start time before another soft-start. The hiccup reduces the power dissipation of the IC under short circuit conditions. If the hard short is removed, IC will go back to normal operation.

Layout Consideration

The layout design of WD1038DH regulator is relatively simple. For the best efficiency and minimum noise problems, we should place the following components close to the IC: Cin, L, RH and

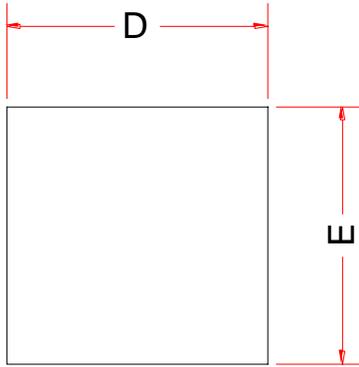

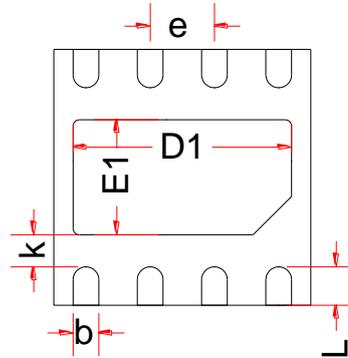

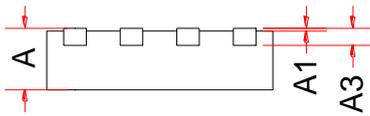

RL.

1) It is desirable to maximize the PCB copper area connecting to GND pin to achieve the best thermal and noise performance. If the board space allowed, a ground plane is highly desirable. Reasonable vias are suggested to be placed underneath the ground pad to enhance the soldering quality and thermal performance.

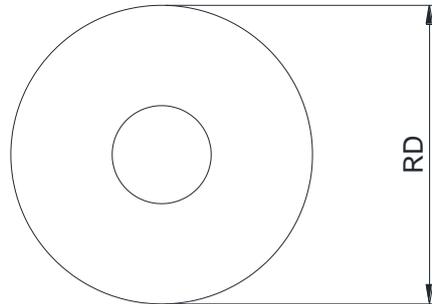

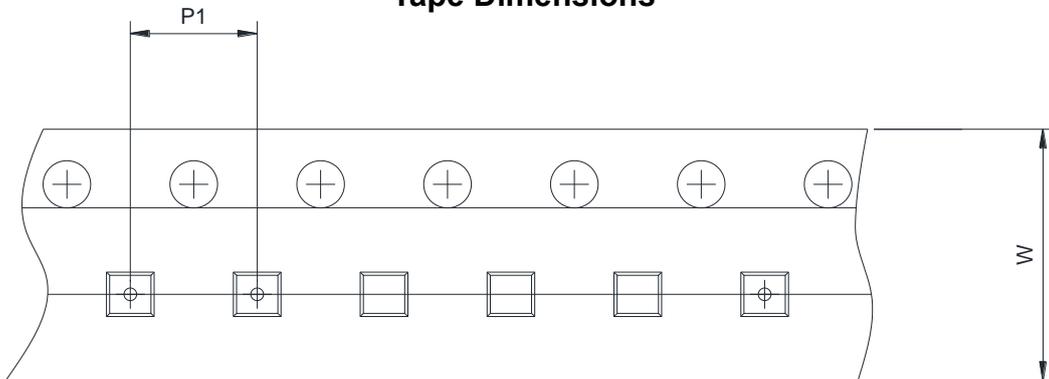

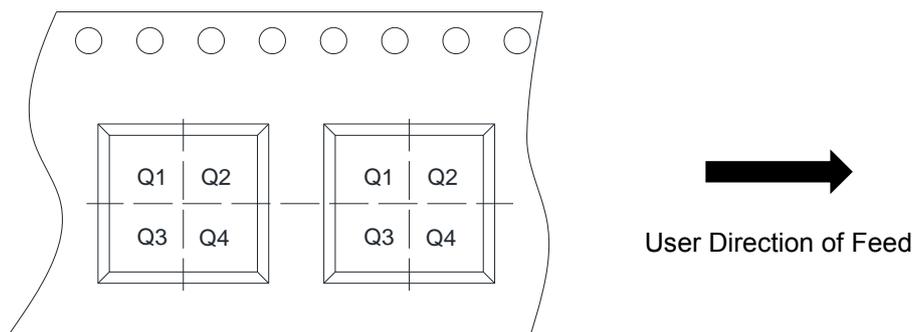

2) Cin must be close to Pins VIN and GND. The loop area formed by Cin and GND must be minimized. Cout must be close to the Chip, too.

3) The PCB copper area associated with SW pin must be minimized to avoid the potential noise problem.

4) The components RH and RL, and the trace connecting to the FB pin must NOT be adjacent to the SW net on the PCB layout to avoid the noise problem.
